LABOUR MARKET OUTLOOK FOR ONTARIO, 1981-1986

SUMMARY AND CONCLUSIONS

1. *The labour market in Ontario over the next five years, under our medium growth economic scenario, is projected to be relatively tight. The growth in employment is projected to be slightly higher than the growth in the labour force. These projections assume that growth in employment would not be impeded by bottlenecks in the labour markets. However, it may not be feasible to achieve this projected growth in employment if the recent shortages of skilled and experienced workers persist.*

2. *Over the next five years, employment in Ontario is projected to grow by 110,300 per year and the labour force is projected to increase by approximately 100,000 persons per year. Females would account for 60 per cent of this increase in the labour force.*

3. *On the average, 170,200 job openings per year would become available as a result of growth in employment and because of the need to replace retiring workers. The educational and/or training mix of workers required to fill these jobs is projected to be as follows:*

   - *4.3 per cent will require a university degree;*
   - *7.4 per cent will require graduation from a college program;*
   - *14.0 per cent will require either a university degree or graduation from a college program;*
   - *29.7 per cent will require a high school graduation;*
   - *10.3 per cent will rquire training in a highly skilled blue-collar trade;*

WHITE COLLAR OCCUPATIONS

- 5.3 per cent will require training in medium skilled blue-collar trades;
- 28.9 per cent will be in low skilled blue-collar occupations.

4. On the average, 167,500 persons per year would be entering Ontario's labour force from various sources. The composition of these new entrants to the labour force from these sources is projected to be as follows:

- 64.4 per cent would come from the formal education sector in Ontario;
- 31.7 per cent would be entering for the first time or re-entering the labour force from households;
- 2.4 per cent would be entering the civilian work force after being released from the armed forces;
- 1.5 per cent would be the net gain from international and inter-provincial migration.

5. Of the 167,500 new entrants who will be entering the Ontario's labour force annually:

- 13.3 per cent would have completed a university degree;
- 10.3 per cent would have completed a college program;
- 14.9 per cent would enter the labour force without completing their program either at the university or college level;
- 34.1 per cent would have completed a high school education, roughly half of these being labour force entrants from the households;
- 25.7 per cent would enter the labour force without completing a high school education;
- 1.7 per cent would enter the labour force from the community colleges or from the armed forces with training in highly or medium skilled blue-collar occupations. In addition to these new entrants,

8,800 workers currently employed would be completing apprenticeship and/or modular training programs annually leading to highly skilled tradesmen status.

6. *An analysis of the potential imbalances between the projected manpower requirements and supply over the 1981-86 period indicates that:*

- *Over the next five years, the combined supply of university and college graduates will fall short of the projected requirements by about 4,500 per year, under our medium-growth scenario.*

- *The overall supply of university graduates would far exceed the projected requirements. However, this does not necessarily mean that unemployment among university graduates will increase. It is more likely that they will take jobs not requiring a university degree. In some occupations, such as engineering and computer related professions, the shortages currently being experienced will get worse.*

- *Employment opportunities for college graduates appear to be much more promising. In fact, for some occupations where the colleges are the main source of supply, such as in the case of engineering technicians and technologists, the college system will not be producing enough graduates to meet the need.*

- *Our analysis indicates the co-existence of shortages of post-secondary graduates in some fields of study and a surplus in others. This leads us to conclude that the magnitude of manpower shortages in some specific disciplines is likely to be more severe than the overall shortfall of 4,500 college and university graduates per year would suggest.*

- *Shortages in the highly skilled and medium skilled blue-collar occupations currently being experienced are projected to continue in the future. The potential supply from the apprenticeship and modular training programs would provide roughly half of the manpower requirements for these occupations.*

- *The total supply of low skilled white-collar workers will slightly exceed the number of job openings in this category. This group, which includes youth under age 19, consists of those who enter the labour market without completing their education at the post-secondary level and those with just a high school education. While the youth unemployment rate may decline somewhat because of the declining youth population, the youth unemployment problem is likely to continue.*

- *On the other hand, the total supply of low skilled blue-collar workers will fall slightly short of the projected requirements for these workers.*

7. *Even in the high-growth scenario, the manufacturing sector which employs roughly one-quarter of the total work force in Ontario, will be contributing only 17 per cent to the total growth in employment during the 1981-86 period.*

LIST OF TABLES

LIST OF APPENDICES

INTRODUCTION

The purpose of this report is to provide projections of manpower requirements and supply in Ontario for blue- and white-collar occupations by level of education to the mid-1980's, examine the imbalances between projected requirements and supply, and draw out the implications of the imbalances for manpower issues.

The report consists of three chapters. Chapter I presents the projections of manpower requirements for blue- and white-collar occupations by level of education. These projections are based on our current understanding of the future economic trends and would therefore have to be modified if the economic outlook changes significantly. Indeed because of the recent energy accord between the Federal and Alberta Governments, and its long-term economic implications for Ontario, the Ontario Manpower Commission will be updating the projections presented in this report.

Chapter II presents projections of population, labour force, net additions to the labour force, and the potential labour supply from the formal education sector, apprenticeship programs, interprovincial and international migration and the household sector in Ontario. Chapter III concludes with a discussion of the potential imbalances between projected manpower requirements and supply and their implications for manpower issues in Ontario over the 1981-86 period.

CHAPTER I

EMPLOYMENT OUTLOOK FOR ONTARIO, 1981 TO 1986

This chapter presents employment projections by industry for Ontario between 1981 and 1986. It also includes information on the total number of job openings, due to growth in employment and replacement needs, by industry. Finally, it presents the distribution of total job openings by blue- and white-collar occupations and by level of education and/or training.

In order to cover a plausible range of employment outlooks for Canada and Ontario between 1981 and 1986, three macroeconomic scenarios (low, medium, and high-growth) were prepared on the basis of three different sets of underlying assumptions concerning the domestic and foreign economic environments. The projections of employment for Canada were made using the University of Toronto's FOCUS (Forecasting and User Simulation) model. After the national employment projections were obtained, the Industry-Ontario model, also at the University of Toronto, was used to derive the employment projections by industry for Ontario. On the basis of these projections, the total numbers of job openings in Ontario due to growth in employment and replacement needs were estimated for blue- and white-collar occupations. These projections were in turn prepared by industry and for the various levels of education and/or training within those occupations.

Accordingly, this chapter begins with an overview of our national employment projections and their comparison with other available national employment projections. It proceeds to a discussion of provincial projections of employment and job openings for blue- and white-collar occupations by industry, and concludes with our projections of the numbers of job openings by level of education and/or training within these occupations between 1981 and 1986.

It should be noted that the figures for 1981-86 presented in this report reflect the underlying assumptions on which they are based. It cannot be emphasized too strongly that these projections are not a statement about what will happen, or what should happen. They are a conditional statement about what may happen if the underlying assumptions hold.

1. National Employment Projections, 1981 to 1986

The national employment projections for the period 1981-86 were generated using the FOCUS model, which is a quarterly macroeconometric model of the Canadian economy developed and maintained at the Institute for Policy Analysis of the University of Toronto. The model contains a total of just over 500 variables describing the domestic and foreign economic environment. Of these, approximately 185 are exogenous variables for which, depending on the different assumptions made, different values can be assumed in order to make projections of the national economy.

Three macroeconomic scenarios relating to low-growth, medium-growth and high-growth were prepared on the basis of underlying assumptions made for the key exogenous variables in the FOCUS model. The distinction among the low, medium and high-growth scenarios lies primarily in the different assumptions made regarding the strength of recovery in the U.S. economy in 1981 and its subsequent growth. These assumptions are set out in detail in Tables 1, 2 and 3.[1]

The national projections obtained with the FOCUS model on the basis of the assumptions described in the preceding sections show that real economic growth in Canada will be somewhat slower between 1981 and 1986 than in the 1970's. Even in the high-growth scenario, real gross national product (GNP) is projected to increase at an average annual rate of only 3.3 per cent between 1981 and 1986, which is much lower than the annual average of

---

[1] At the time this report was being prepared the Alberta and Federal Government were negotiating an energy price agreement. An energy accord was reached on September 1, 1981. Under the agreement, the wellhead price for existing conventional oil will rise to $57.75 a barrel in mid-1986 while the price of new oil produced from new fields, oil sands and on Canada Lands will increase to $77.48 per barrel by 1986. Our projections are based on the assumption that the blended domestic price of oil will increase to approximately $50 per barrel by 1986.

[a] "Real" means constant dollars.

[b] M1, the narrowly defined money supply, is the sum of currency held by the public and demand deposits that are payable by banks on demand through the presentation of a cheque.

3.7 per cent experienced in the seventies (see Table 4 and Appendices I-A, I-B, and I-C). In the low- and medium-growth scenarios the increase in real GNP is projected at an average annual rate of 2.9 and 3.0 per cent, respectively.

As a result of the relatively slow growth in real GNP, total employment in Canada is expected to grow at an annual average rate of between 2.3 (low-growth) and 2.6 per cent (high-growth) between 1981 and 1986 (see Table 4). This rate is lower than the annual average growth rate of 3.2 per cent in the seventies and 2.8 per cent in the sixties.

The growth in employment in all three scenarios will be greater in 1981 than in 1980. In 1980 employment in Canada increased by 286,000, and in 1981 it is projected to increase by 307,000 in the low-growth scenario and 384,000 in the high-growth scenario but the projected increase is still below the increase of 397,000 experienced in 1979. The Canadian economy is expected to improve in 1982 and 1983. Employment is expected to increase by 199,000 and 282,000 in the medium-growth scenario in 1982 and 1983, respectively. A gradual slowdown in the economy is projected to start in 1984, which will result in a growth of employment of 269,000 in the low-growth scenario and 291,000 in the high-growth scenario in 1986.

2. A Comparison of the Available Projections of National Employment

Several short-term and medium-term projections of national employment and output are currently available. The short-term projections, those for up to three years into the future, include the quarterly projections made by Data Resources of Canada (1981 to 1983), the Conference Board of Canada (1981 to 1982), the annual projections made by Royal Bank of Canada (1980 to 1982), Wood Gundy (1980 to 1983), and Chase Econometric (1980 to 1982). The medium-term projections, those for up to ten years into the future, include those by Data Resources of Canada (1980 to 1990), and the Department of Finance (1980 to 1985). It should be noted that the projections made by Royal Bank of Canada and the Department of Finance relate only to rates of change in the levels of employment and in the real GNP. A summary comparison appears in Table 5.

The projections from the above sources suggest an employment range of between 10,377,000 and 11,034,000 for Canada in 1981, whereas our

low and high projections for that year are 10,962,000 and 11,039,000. Similarly, our projections for 1982 in all three scenarios fall within the employment ranges of 10,688,000 and 11,316,000 provided by these sources.

The sources listed earlier project a Canadian employment level between 10,945,000 and 11,596,000 for 1983. Our low- and medium-growth projections fall within this range, but our high-growth projections are slightly higher.

From 1984 to 1986 the only other source which provides projections of national employment level are those of Data Resources of Canada, whose medium-term projections are very similar to our medium-growth scenario. In addition, other medium-term projections are also provided by the Federal Department of Finance but they are given only in terms of annual rate of growth. Our medium-growth projections for 1984 and 1985 are similar to those projected by the Department of Finance.

In general, our projections of national employment are in line with the more recent projections set out by the Conference Board of Canada, and Data Resources.

3. National Employment Projections by Industry, 1981 to 1986

The projections of total employment for Canada were disaggregated by industry using the Industry-Ontario model.[2] The employment projections by

---

[2]The Industry-Ontario model takes ten categories of real final demand expenditure from the FOCUS model and translates them into national real domestic product for 23 industries through an impact matrix prepared from Statistics Canada's 1971 input-output tables. Employment in each industry is then determined on the basis of the projected real domestic product and the estimated average hours worked required each year in that industry combined with productivity-growth trends projected into the future. Lastly, the sums of industrial output and employment are constrained to equal the national figures of the corresponding scenario developed with the FOCUS model. This report presents employment projections for 11 major industry sectors only.

The ten categories of real final demand expenditure are consumption expenditure on durable goods, semi-durable goods, non-durable goods, and consumer services, business and non-residential construction, business investment in machinery and equipment, government investment in construction, government investment in machinery and equipment, exports of goods and services, and government expenditure on goods and services.

industry and the annual net change in employment between 1981 and 1986 for the 11 major industries are presented in Tables 6 and 7, respectively.

These projections suggest that the Canadian employment structure will continue to evolve as in the past. In the seventies most services-producing industries; finance, community, business and personal services, public administration and trade were the fastest growing sectors in employment (see Table 8). Between 1981 and 1986 finance and trade are projected to continue as the fastest growing sectors, but in all three scenarios employment in community, business and personal services and public administration is projected to grow at a slower pace than in the past.

Among the secondary goods-producing industries, employment in construction is projected to grow at a slightly more rapid rate than in the seventies. Employment in this industry is expected to grow at an average annual rate of 3.0 (low-growth) and 3.2 per cent (high-growth) over the 1981-86 period, compared to an average annual growth rate of 2.9 per cent in the seventies. However, this growth is contingent upon the realization of the energy-related investment projects in the West. Employment growth in manufacturing is projected to stabilize at an average annual rate of 1.4 (low-growth) and 1.8 per cent (high-growth) between 1981 and 1986. The manufacturing industry experienced a sharp decline from an average growth rate of 2.4 per cent in the sixties to 1.8 per cent in the seventies. Employment in utilities is projected to grow less rapid during this period than in the seventies.

Between 1981 and 1986 employment is projected to grow very little in most primary goods-producing industries except mining, in which a moderate gain in employment is expected during this period.

As a consequence of the changes in the growth rate for the various industries, the following shifts in the contribution of each individual sector to total employment growth are expected to occur between 1981 and 1986.

- The secondary goods-producing industries will contribute a larger share to the total employment growth during this period, than in the past decade. These industries together are projected to account for between 21.1 (low-growth) and 22.6 per cent (high-growth) of the total increase over the 1981-86 period compared to that of 18.8 per cent in the seventies.

[a]Data calculated from revised Labour Force Survey

- The contribution to the total growth by the services-producing industries is expected to decline from 79 per cent in the seventies to between 78 (low-growth) and 75 per cent (high-growth) over the projection period.

- The contribution of the primary goods-producing industries to total growth is expected to decline slightly from 2.2 per cent in the seventies to 1.9 per cent (medium-growth) between 1981 and 1986.

- In terms of individual industry sectors, community, business and personal services, and trade are projected to continue to provide the largest share (about between 53 and 54 per cent) of the total increase over the 1981-86 period. These industry sectors together accounted for slightly over 56 per cent of the total growth in the past decade.

- Manufacturing is projected to account for between 11.9 per cent (low-growth) and 13.8 per cent (high-growth) of the total increase over the 1981-86 period compared to that of 12.6 per cent in the 1970's.

In summary, total employment in Canada is projected to increase by 280,000 per year in the medium-growth scenario between 1981 and 1986. About 67 per cent of the total growth is expected to occur in trade, community, business and personal services, and manufacturing, averaging yearly 186,700. The balance of the total growth will be contributed by finance (30,800), construction (21,200), transportation and communication (18,800), public administration (12,800), mining (6,800) and utilities (4,200).

4. Provincial Employment Projections, 1981 to 1986

Projections of provincial employment were made, using the Industry-Ontario model, by applying the Ontario proportion of national employment to the projection of national employment by industry. The sum of the projections of employment in all industries gives an estimate of the projections of total

employment for Ontario. (Projections of total employment and the annual net change in employment by industry for Ontario between 1981 and 1986 appear in Tables 9 and 10).

4.a. Total Employment in Ontario

The total employment in Ontario between 1981 and 1986 is projected to grow more slowly than it did in the previous decade. Between 1981 and 1986 total employment is projected to increase by 102,000 per year in the low-growth scenario and 115,300 per year in the high-growth scenario. These projections imply an average annual rate of employment growth of 2.4 (low-growth) and 2.7 per cent (high-growth), rates which are much lower than the 3.2 per cent growth rate experienced in the seventies.

Under the medium-growth scenario, employment in Ontario in 1981 is projected to increase by 124,000 (or 3.0 per cent) which is much higher than the net increase in employment of 58,000 in 1980[3]. In 1982 employment is projected to increase by 88,000 or 2.1 per cent in the medium-growth scenario. The rate of growth in employment is expected to be relatively strong in 1983 and 1984, but it is projected to decline slightly in 1985 and 1986 (see Appendix IX).

4.b. Employment by Industry in Ontario

These projections suggest that Ontario's employment structure will continue to shift as in the past.

Among the services-producing industries, finance, community, business and personal services, public administration, and trade were the leading sectors contributing to growth in employment in the seventies. Between 1981 and 1986 trade and finance are projected to continue as the fastest growing sectors, but employment in the community, business and

---

[3] The latest short-term forecast for the Ontario economy was made available by the Conference Board of Canada in August, 1981. The forecast indicated that employment in Ontario would rise from 4,066,000 to 4,187,000 in 1981, a net increase of approximately 121,000. In the 1981 Ontario Budget the Minister of Treasury and Economics projected employment in Ontario in 1981 will increase by 106,000 to 4,172,000.

personal services, and public administration is expected to grow at a much slower pace than in the past decade (see Table 11).

Employment in the secondary goods-producing industries in Ontario is projected to grow more slowly than in the seventies. This is contrary to the growth pattern projected at the national level at which a similar rate of growth as in the seventies is projected for these industries. Employment in the construction industry in Ontario is projected to increase moderately at an annual rate of 1.5 (low-growth) and 1.8 per cent (high-growth) over the projection period compared to an annual rate of 1.9 per cent experienced in the seventies. Employment in manufacturing is projected to grow at an average annual rate of 1.5 (low-growth) and 1.9 per cent (high-growth) between 1981 and 1986, rates which are much below the rate of 2.3 per cent experienced in the seventies. Employment growth in utilities is projected to decline from an average annual rate of 3.9 per cent in the seventies to between 2.1 (low-growth) and 2.4 per cent (high-growth) over the projection period.

Of the primary goods-producing industries, employment in mining is expected to grow strongly at an annual rate of 2.8 (low-growth) and 3.4 per cent (high-growth) between 1981 and 1986. It grew only at an average rate of 0.7 per cent in the past decade. Employment in other primary industries including agriculture, fishing and forestry, is expected either to decline slightly or to gain marginally over the projection period.

As the result of changing industrial growth, the industrial contribution to overall employment growth in Ontario is expected to shift as follows:

- The services-producing industries will continue to contribute a larger share to total growth between 1981 and 1986. They are projected to account for between 79 (low-growth) and 77 per cent (high-growth) of the total increase during this period compared to that of 75.7 per cent experienced in the seventies.

- The contribution of the secondary goods-producing industries to the total growth is expected to decline from 22.6 per cent in the seventies to between 20 (low-growth) and 22 per cent (high-growth) over the 1981-86 period.

TABLE 11

INDUSTRIAL COMPOSITION OF EMPLOYMENT GROWTH:

ONTARIO, 1971 TO 1986

Industry	Average Annual Rate of Change in Employment (%)				Percentage Contribution of Total Employment Growth			
	Historical	Projected: 1981-86			Historical	Projected: 1981-86

[a]Data calculated from revised Labour Force Survey

- The overall contribution of the primary goods-producing industries to the total growth is projected to decline slightly between 1981 and 1986. However, the mining sector is expected to account for a significantly larger share (about 1.5 per cent) of the total growth during this period compared to the 0.3 per cent in the past decade.

- In terms of individual industry sectors, trade, and community, business and personal services are expected to account for the largest share of the projected total increase. The trade, and community, business and personal services together are projected to account for slightly over 59 per cent (medium-growth) of the total increase between 1981 and 1986. They accounted for 54.6 per cent of the total growth in the seventies. Much of this growth came from the trade sector.

- The contribution of manufacturing to the total employment growth is expected to decline. Manufacturing accounted for 17.8 per cent of the total employment growth in the seventies and is expected to account for between 15.7 (low-growth) and 17.5 per cent (high-growth) of the projected total increase over the 1981-86 period. It should be noted that the manufacturing industry is also expected to account for a steadily declining share of total employment in Ontario because of the projected slower rate of growth. This industry employed 27.3 per cent of total work force in Ontario in 1971 and 24.9 per cent in 1980 and is expected to account for only 23.8 per cent by 1986.

In summary, total employment in Ontario is projected to increase by 110,300 per year (2.5 per cent) in the medium-growth scenario between 1981 and 1986. Trade, and community, business and personal services together are expected to account for 65,100, while manufacturing is expected to account for 18,700. The balance of the total growth will be contributed by finance (11,000), transportation and communication (6,000), construction (4,000), public administration (3,700), mining (1,700) and utilities (1,300).

5. Job Openings Due to Growth and Replacement by Industry for White- and Blue-Collar Occupations: Ontario[4]

The number of job openings that become available in an occupation is the sum of the net change in employment and the replacement needs resulting from retirement, deaths, and inter-occupational and inter-regional mobility. Since no data are currently available on job openings due to inter-occupational and inter-regional mobility, the estimates of replacement needs presented in this report include only the number of jobs that will become available because of retirements and deaths in the work force. Projections of job openings due to retirement were made by "aging" the employed labour force year by year and assuming that workers will retire at age 65. Projections of job openings due to deaths were obtained by applying age-specific mortality rates to the 1971 Census data on the total employed labour force in the blue-collar, white-collar and other unspecified occupations by industry.[5] The estimates of job openings due to replacement needs were then adjusted based on the 1976 Census data in order to account for attritions to additions to the work force between 1971 and 1976.[6]

The projections of annual job openings due to net change in employment in each industry between 1981 and 1986 were also broken down into blue- and white-collar occupations on the basis of the 1971 Census data for Ontario, which provided data on employment by industry and occupation. It

---

[4]For the purposes of this report, white-collar occupations are broadly defined to include managerial, the professional, clerical, sales and some services occupations. Blue-collar occupations are defined to include occupations in processing, machining, product fabricating, construction, transportation equipment, other crafts, farming, fishing, mining and some services.

[5]Other unspecified occupations are defined to include occupations not elsewhere classified or not stated.

[6]Because data on age-sex composition of additions to the work force after 1976 are not available, it was not possible to estimate attrition to these additions. The magnitude of replacement needs arising from attrition to these additions is expected to be small.

was assumed that the proportion of blue- and white-collar workers during the projection period will remain constant at the 1971 level.[7]

Projections of total job openings, both due to growth in employment and replacement needs, for white-collar, blue-collar and other workers by industry for each year of the projection period are presented in Appendices XII, XIII and XIV. All three scenarios are summarized in Table 12.

These projections suggest that between 1981 and 1986 there will be an average of over 161,900 job openings per year in Ontario. Roughly 56 per cent of these will be in white-collar jobs, and only 39 per cent will be in blue-collar jobs.

The projections also show that in all three scenarios growth in employment will account for a much higher proportion of job openings than replacement needs. However, growth in employment is a much greater factor in white-collar than in blue-collar job openings. In the low-growth scenario, 69.1 per cent of all white-collar job openings and only 57.2 per cent of all blue-collar job openings will be due to growth. In the medium- and high-growth scenarios these proportions increase for both white-collar and blue-collar occupations, and in the high-growth scenario as much as 71.1 per cent of the white-collar job openings and 61.2 per cent of the blue-collar job openings are due to growth.

The projections of job openings by industry show that in all three scenarios, community, business and personal services, and trade combined are expected to account for roughly 51 per cent of the total job openings over the 1981-86 period. Approximately 26 per cent of the total job openings will be in community, business and personal services, and over one-quarter will be in trade. Manufacturing is expected to account for about 20 per cent of the total job openings over the projection period. The projections of job openings by industry, given in detail in Tables 12 and 13, are discussed in more detail below:

---

[7] Employment Hours and Earnings, published by Statistics Canada, provides monthly employment estimates of salaried workers and wage earners in the mining, manufacturing, and construction industries. The data show that the proportions of salaried workers in mining and construction have increased gradually since 1975, but it remained unchanged in manufacturing. This seems to suggest that the white-collar occupations are likely to be understated and blue-collar occupations overstated in industries such as mining and construction when a single-year (1971) industry-occupation matrix is used for projection.

[a]No estimates are shown when replacements would be greater than total job openings as a result of a net decline in employment in a given industry or occupation group.

The community, business and personal services sector is expected to account for an average of 43,400 job openings per year between 1981 and 1986 in the low-growth scenario; this figure represents 27 per cent of the total annual job openings. In the high-growth scenario, this sector is expected to account for 46,200 job openings, representing 26 per cent of the total (see Table 14). More than 64 per cent of the job openings are estimated in white-collar jobs (see Table 12), of which approximately 29 per cent are expected to be created by replacement needs (see Table 13). Blue-collar jobs are expected to account for about 33 per cent of the job openings in this sector and of these approximately one-third are estimated to result from replacement needs.

The trade sector is expected to account for 40,400 and 43,100 job openings per year in the low- and high-growth scenarios respectively, representing 25 per cent of the total related job openings. In each scenario more than 70 per cent of the job openings are estimated to be white-collar jobs, of which over 22 per cent are expected to result from replacement needs. Blue-collar jobs are projected to account for about 27 per cent of the job openings in this sector and of these about 17 per cent are estimated to be generated by replacement needs.

The manufacturing sector is expected to account for 31,200 job openings per year, or approximately 19 per cent of the total job openings between 1981 and 1986 in the low-growth scenario. Roughly two-thirds of these job openings are estimated in blue-collar jobs, of which 49 per cent are expected to be created by replacement needs.

In the medium-growth scenario manufacturing is expected to account for 33,900 job openings per year, or about 20 per cent of the total job openings in Ontario. Two-thirds of these job openings are estimated for blue-collar jobs, of which 45 per cent are expected to be created by replacement needs.

In the high-growth scenario manufacturing is expected to account for 35,400 job openings per year, or about 20 per cent of the total job openings in Ontario. Two-thirds of these job openings are estimated for blue-collar jobs, of which 43 per cent are expected to be created by replacement needs.

TABLE 14

PERCENTAGE DISTRIBUTION OF TOTAL JOB OPENINGS BY INDUSTRY: ONTARIO, 1981 TO 1986

INDUSTRY	LOW-GROWTH SCENARIO	MEDIUM-GROWTH SCENARIO	HIGH-GROWTH SCENARIO
AGRICULTURE/FISHING	0.8	1.0	1.0
FORESTRY	0.2	0.2	0.2
MINING	1.4	1.4	1.5
MANUFACTURING	19.3	19.9	20.2

TRANSP./COMM.	5.7	5.8	5.9
TRADE	25.0	25.1	24.6
FINANCE	8.1	7.9	7.8
SERVICES	26.8	26.3	26.4
PUBLIC ADMINISTRATION	5.6	5.3	5.1
UNSPECIFIED INDUSTRIES	2.1	2.0	1.9
TOTAL	100.0	100.0	100.0

All other industrial sectors are expected to account for 46,900 job openings per year in the low-growth scenario and 50,500 job openings per year in the high-growth scenario between 1981 and 1986. Within this group of industries, finance, transportation and communication, public administration, construction, and utilities combined account for 40,000 job openings in the low-growth scenario and 42,600 job openings in the high-growth scenario.

The data on the contribution of each of the industries in this group are presented in Table 12. Approximately 53 per cent of the job openings in these industries are projected to be white-collar jobs (in the medium-growth scenario). Among these white-collar jobs replacement needs are expected to account for 33 per cent. On the other hand, replacement needs for blue-collar jobs are expected to account for 55 per cent of the job openings.

6. Job Openings due to Growth and Replacement Needs by Level of Education and/or Training: Ontario

The projections of the total job openings for blue-collar and white-collar occupations by industry in Ontario were further subdivided according to the level of formal education or special vocational training normally required for working in each occupation.

The white-collar occupations were divided into four categories: occupations filled primarily by university graduates, those filled primarily by university or college graduates or certified professionals, occupations filled primarily by college graduates, and those normally not requiring university or college graduation.

For the purpose of this report, blue-collar occupations were divided into highly skilled trades, medium skilled trades, and low skilled occupations. Highly skilled trades are defined as trades requiring two years or more of special vocational training, medium skilled trades are defined as trades requiring six months to two years of such training, and low skilled occupations are defined as those requiring less than six months of special vocational training.[8]

---

[8]This classification scheme was developed on the basis of the listing of individual occupations appearing in the Canadian Classification and Dictionary of Occupations (CCDO) and was further refined in consultation with training specialists in the Ministries of Education and Colleges and Universities.

The 1971 Census data for Ontario were used to calculate the proportion of total employment in each of these occupation clusters (see Appendix XV). These proportions were then applied to the projected total number of job openings for blue- and white-collar occupations. The projected total number of job openings for blue- and white-collar occupations by level of education and/or training for the three scenarios, presented in Table 15, show that there will be a total of 971,200 job openings in the low-growth scenario and 1,051,200 job openings in the high-growth scenario during the projection period. Of these, between 542,600 and 580,600 respectively (about 56 and 55 per cent) are expected for white-collar workers. A detailed breakdown of job openings within white-collar and blue-collar occupations by level of education and training follows.

White-Collar Occupations

In the low-growth scenario a total of 542,600 white-collar job openings are projected during the 1981-86 period, or about 90,400 job openings per year. Of these 90,400 job openings 7,100 are expected to be filled primarily by university graduates. Another 22,900 job openings per year can be filled either by university or college graduates or certified professionals. The number of job openings in white-collar occupations filled primarily by college graduates in Ontario is projected to be 12,000 per year. About 54 per cent of all white-collar jobs normally do not require university or college graduation, and thus the number of job openings in these jobs is projected to be 48,500 per year between 1981 and 1986.

In the medium-growth scenario a total of 566,300 white-collar job openings are projected over the 1981-86 period, or approximately 94,400 job openings per year. Of these 94,400 job openings 7,400 are expected to be filled primarily by university graduates. Another 23,900 job openings per year can be filled either by university or college graduates or certified professionals. Between 1981 and 1986 the number of job openings in white-collar occupations filled primarily by college graduates in Ontario is projected to be 12,600 per year, and the number of job openings in white-collar occupations that normally do not require college or university graduation is projected to be 50,600 per year.

TABLE 15

TOTAL JOB OPENINGS DUE TO GROWTH AND REPLACEMENT NEEDS IN WHITE-COLLAR AND BLUE-COLLAR OCCUPATIONS

BY LEVEL OF EDUCATION/TRAINING: ONTARIO, 1981 TO 1986

Filled by University Graduates	8,300	6,600	7,600	7,600	7,500	7,900	45,400	7,600
Filled by University or College Graduates, or Certified Professionals	26,900	21,300	24,500	24,600	24,100	25,400	146,700	24,500
Filled by College Graduates	14,200	11,200	12,900	12,900	12,700	13,400	77,200	12,900
Normally not Requiring College or University Graduation	57,100	45,100	51,900	52,100	51,100	53,900	311,200	51,900
Blue-Collar Occupations	76,000	56,700	67,700	65,100	75,500	76,800	417,600	69,600
Highly Skilled Occupations	19,800	14,800	17,700	17,000	19,700	20,000	108,900	18,200
Medium Skilled Occupations	10,200	7,600	9,100	8,700	10,100	10,300	56,100	9,400
Low Skilled Occupations	46,000	34,300	40,900	39,400	45,700	46,500	252,600	42,100
Other (Unspecified) Occupations	9,400	7,000	8,600	9,400	8,700	9,900	53,000	8,800

Note: Figures may not add up to totals because of rounding.

In the high-growth scenario a total of 580,600 job openings are projected during the 1981-86 period, or approximately 96,800 job openings per year. Of these 96,800 job openings 7,600 are expected to be filled primarily by university graduates. Another 24,500 job openings per year can be filled either by university or college graduates or certified professionals. Between 1981 and 1986 the number of job openings in white-collar occupations filled primarily by college graduates in Ontario is projected to be 12,900 per year, and the number of job openings in white-collar occupations that normally do not require college or university graduation is projected to be 51,900 per year.

Blue-Collar Occupations

In the low-growth scenario a total of 378,800 job openings for blue-collar jobs are projected between 1981 and 1986, or approximately 63,100 job openings per year. Of these 63,100 job openings 16,500 are expected to be for highly skilled tradesmen (i.e., those requiring more than two years of special training). The total number of job openings for medium skilled workers (i.e., those with six months to two years of special vocational training) is projected to be approximately 8,500 per year, and the total job openings in low skilled occupations (which require less than six months of special vocational training) is projected to be about 38,200 per year during the same period.

In the medium-growth scenario a total of 403,500 job openings for blue-collar workers are projected between 1981 and 1986, or about 67,300 job openings per year. Of these 67,300 job openings 17,500 are expected to be for highly skilled tradesmen, 9,000 for medium skilled workers and 40,700 for low skilled workers.

In the high-growth scenario a total of 417,600 job openings for blue-collar workers are projected between 1981 and 1986, or approximately 69,600 job openings per year. Of these 69,600 job openings 18,200 are expected to be for highly skilled tradesmen, 9,400 for medium skilled workers, and 42,100 for low skilled workers.

CHAPTER II

LABOUR SUPPLY PROJECTIONS FOR ONTARIO, 1981 TO 1986

This chapter contains annual projections of the population, labour force participation rates and the labour force in Ontario between 1981 and 1986. It also includes projections of potential labour supply from the formal education sector, the armed forces, other training programs, interprovincial and international migration, and the household sector.

The chapter begins with an overview of the total population projection for Ontario. Next are sections summarizing the projected working-age population and its age-sex distribution, changes in the participation rates and their projected effect on the labour force, and the consequent net additions to the labour force by age and sex. The chapter concludes with a summary of projections of potential labour supply from the formal education sector, other training programs, the armed forces, interprovincial and international migration, and the household sector.

1. Total Population

The total population in Ontario is projected to increase from 8.7 million persons in 1981 to 9.1 million persons by 1986.[1] These projections are based on the 1976 Census and incorporate the following assumptions:

a. The fertility rate is assumed to decline from 1.71 per cent in 1981 to 1.68 per cent in 1986;

---

[1]Unpublished data from Statistics Canada.

b. Net international migration to Ontario is assumed to be 27,000 per year during the 1981-86 period.

c. The present westward shift in population from Ontario to Alberta and British Columbia is assumed to continue through out the projection period.

In making labour force projections it is the working-age population—i.e., the population 15 years of age and above—that is of concern rather than the total population. This segment of the population is examined in greater detail below.

2. Working-Age Population

The working-age source population[2] in Ontario (hereafter referred to as the working-age population) is projected to increase from 6.5 million persons in 1980 to 7 million persons by 1986 (see Table 16). This means that during the projection period the working-age population in Ontario will not grow even half as fast (1.2 per cent) as it did between 1970 and 1975 (2.7 per cent). This slowdown was evident during the 1976-80 period when the growth rate of the working-age population decelerated to 1.9 per cent annually.

Not only will the rate of growth in the working-age population slow down, but the age composition of the working-age population will also shift markedly towards older people because of the uneven rates of growth for the various age groups (see Table 17). The two major changes in population growth rates during the 1981-86 period are as follows:

---

[2]The working-age source population is defined as the non-institutional civilian population 15 years of age and over. The ratio between the actual working-age source population in 1980 (taken from Statistics Canada's Labour Force Survey) and the total working-age population projected by Statistics Canada for 1980 was calculated. This ratio was used as a constant adjustment factor to derive the working-age source population from Statistics Canada's projections of the total working-age population for the period 1981-86.

Total	2.7	1.9	1.2

- The population in all age groups is expected to experience a decline in the rate of growth, except the 35-to-44 age group which will experience an increase. The average annual rate of growth for population in the 35-to-44 age group is projected to be 3.5 per cent between 1981 and 1986. This represents a sevenfold increase from 0.5 per cent experienced during 1970 and 1975 and more than double the increase experienced during 1976 and 1980.

- For the first time the population in the 15-to-19 age group is projected to experience a decline in its absolute size. This age group had the second highest growth rate (2.8 per cent) between 1970 and 1975, but between 1976 and 1980 this rate decreased to 1.0 per cent. Between 1981 and 1986, the 15-to-19 age group is projected to experience a net decline at an average annual rate of 3.3 per cent.

The projected age-sex distribution of the working-age population is presented in Table 18. The shifts in the growth of the different age groups discussed above will affect the age distribution of the working-age population in the following manner:

- The prime-age group (25-to-44) and those 55 years old and over are projected to form an increasingly high proportion of the working-age population during the 1981-86 period. Their combined share is projected to increase from 61.8 per cent in 1980 to 65.8 per cent in 1986, i.e. an increase of 4.0 per cent. Those in the 35-to-44 age bracket would account for 2.1 per cent of this increase.

- Between 1981 and 1986 persons 15-to-24 years old will form a steadily declining part of the working-age population. This decline will be quite marked for those 15-to-19 years old, whose share of the total working-age population will drop from 12.0 per cent in 1981 to 9.5 per cent in 1986.

TABLE 18

PERCENTAGE DISTRIBUTION OF THE WORKING-AGE POPULATION BY SEX AND AGE:

Total	100.0	100.0	100.0	100.0	100.0

- The population in the 45-to-54 age group will decline from 13.8 per cent of the total working-age population in 1981 to 13.0 per cent in 1986.

In short, the changing age composition of the working-age population will produce an increasingly "older" population, which in turn will be reflected in the composition of the labour force.

3. Labour Force Participation Rates

In order to obtain labour force projections we need to know not only the projected working-age population but also the proportion of the population that will participate in the labour force. Participating in the labour force means either working or actively looking for work, and different age-sex groups in the working-age population participate in the labour force to varying degrees. The participation rate for any age-sex group is defined as the proportion of the population in that group who are members of the labour force.

In this section three sets of projections of the labour force participation rates by sex and age for the years 1981 to 1986 are presented.[3] Projection I is based on the assumption that the increase in the labour force participation rates for the various age-sex groups over the projection period will be slightly lower than the increase experienced over the last five years.

Projection II is based on the assumption that past trends will continue and that the average annual increase in the labour force participation rate for each age-sex group in the 1981-86 period will be similar to that experienced during the last five years. Projection III assumes a slightly higher rate of increase in the participation rates than in the past.

---

[3]Labour force participation decisions of those in the working-age population depend on a wide variety of economic and sociological factors. These factors have been comprehensively described and intensively examined in a study released by the Department of Finance (see D. Ciuriak and H. Sims, Participation Rate and Labour Force Growth in Canada, Department of Finance, April 1980).

The overall labour force participation rate in Ontario is projected to increase from 66.8 per cent in 1980 to 68.4 per cent in 1986 in Projection I, to 70.8 per cent in Projection II, and to 71.9 per cent in Projection III.

The overall female participation rate is projected to increase from 54.3 per cent in 1980 to 57.0 per cent in 1986 in Projection I, to 60.3 per cent in Projection II, and to 61.7 per cent in Projection III.

The overall male participation rate is projected to increase from 79.9 per cent in 1980 to 80.5 per cent in 1986 in Projection I, to 81.8 per cent in Projection II, and to 82.6 per cent in Projection III.

The detailed projections of the participation rates by age and sex are presented in Tables 19 and 20.

4. Labour Force

The size of the labour force is determined by the size of the working-age population and the labour force participation rates. Historical data on the labour force for Ontario for the years 1975 to 1980 are presented in Table 21. By applying the three sets of projections of the labour force participation rates to the working-age population, three sets of projections of the labour force were obtained. These projections are presented in Table 22, and the related growth rates are shown in Table 23.

The labour force in Ontario grew at an average annual rate of 3.8 per cent between 1970 and 1975 and 2.7 per cent between 1976 and 1980. However, in Projection III in which the participation rates are projected to increase to unprecedented levels, the labour force in Ontario is projected to increase at an average annual rate of only 2.4 per cent between 1981 and 1986. In other words, even these higher participation rates would not be adequate to offset the slowdown in the growth of the working-age population.

In Projection II, where past trends in participation rates are expected to continue, the labour force is projected to grow at an average annual rate of 2.2 per cent between 1981 and 1986, and in Projection I, it is projected to grow at only 1.6 per cent. Therefore, in all three projections, the rate of growth in the labour force is expected to slow down throughout the

projection period. However, as in the past, it will remain higher than the rate of growth of the working-age population because of the higher participation rates particularly of women in the labour force.

This slower growth of the labour force will be accompanied by the aging of the labour force. In Projection II the changes in the age-sex distribution of the working-age population, and in the participation rates will affect the labour force growth rates of the various age-sex groups in the following ways (see Table 23 for more details):

- Between 1981 and 1986 the total female labour force is projected to grow almost twice as fast (3.0 per cent) as the total male labour force (1.6 per cent), but even so the projected growth rates are lower than historical trends. As compared with the projected average annual growth rate of 3.0 per cent between 1981 and 1986, the female labour force grew at an average annual rate of 4.2 per cent between 1976 and 1980 and 5.8 per cent between 1970 and 1975.

- Between 1981 and 1986 the prime-age labour force (25-to-44) will grow faster than any other age group. The labour force 35-to-44 years old will grow at an average annual rate of 4.5 per cent between 1981 and 1986, much faster than the rate of only 2.7 per cent between 1976 and 1980 and 1.8 per cent between 1970 and 1975. This increase is caused by higher rates of growth in the population in this age group and increased participation in the labour force by women in this age group.

- The growth rate for the labour force in the 25-to-34 age group has been declining since 1970. The average annual rate of growth of the labour force in this age group declined from 6.9 per cent between 1970 and 1975 to 3.7 per cent between 1976 and 1980, and is projected to decline even further to 3.2 per cent between 1981 and 1986. In spite of this trend the average annual rate of growth for this group will be the second highest during the projection period.

- Youth labour force in the 15-to-24 age group will grow more slowly than any other age group.

  - The labour force in the 15-to-19 age group will experience a net decline at an average annual rate of 2.0 per cent between 1981 and 1986, compared with the phenomenal growth at an annual rate of 7.1 per cent between 1970 and 1975. During the 1981-86 period, the decline in the population of this age group will be so large that despite increasing participation rates the absolute size of the youth labour force will decline.

  - The labour force 20-to-24 years of age will grow at an average annual rate of 1.0 per cent between 1981 and 1986 compared with the rate of 3.4 per cent between 1976 and 1980.

The changes in the growth rates for the different age groups in Projection II would result in the following shifts in the age-sex distribution of the labour force between 1981 and 1986 (see Table 24 for more details):

- The proportion of women in the labour force will increase from 41.8 per cent in 1981 to 43.7 per cent in 1986. The largest portion of this increase will occur in the female labour force 35-to-44 years old, whose share of the total labour force will increase from 8.0 per cent in 1981 to 9.7 per cent in 1986.

- The prime-age group (25-to-44) will account for a larger share of the total labour force. This share is projected to increase from 46.6 per cent in 1981 to 50.3 per cent in 1986. Most of this increase will be accounted for by persons 35-to-44 years old.

65+ Yrs	2.6	2.0	1.7	1.7	1.6	1.9	1.7	1.9	2.0
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

- All other age groups except those 55-to-64 years old will account for a smaller share of the total labour force. The share of the 55-to-64 age group will remain unchanged at 10.2 per cent.

- The largest decline in the share of the labour force will occur among youth in the 15-to-19 age group. Their share will decline from 10.6 per cent in 1981 to 8.7 per cent by 1986.

5. Net Additions to the Labour Force

Table 25 shows that between 1981 and 1986 the labour force will increase by 437,000 in Projection I (low); 599,000 in Projection II (medium); and 676,000 in Projection III (high). Even in Projection III (high) the average annual increase does not match the labour force increases achieved during the 1970-75 period. In both Projection II (medium) and Projection I (low) the labour force increases in the first half of the 1980's are projected to be much lower than those achieved in the 1970's.

The contribution of the various age-sex groups to the net additions to the labour force between 1981 and 1986 in Projection II (medium) are described below:

- As the population from the baby-boom generation move from youth into the prime-age group, this group's share of the total growth in the labour force will increase dramatically. Between 1976 and 1980 this group accounted for 297,000, or more than half of the growth in the labour force. Between 1981 and 1986 the prime-age group is projected to account for 491,000, or four-fifths of the growth in the labour force. The most dramatic change is in the 35-to-44 age group. This age group accounted for only 19.2 per cent of the growth in the labour force between 1976 and 1980. Between 1981 and 1986, this age group will provide 42.2 per cent of the growth in the labour force.

TABLE 25

65+ Yrs	-12	-1.6	-5	-0.9	2	0.5	12	2.0	26	3.8
Total	738	100.0	548	100.0	437	100.0	599	100.0	676	100.0

- The contribution of the 15-to-24 age group to the growth of the labour force will decline during the projection period. Those in the 20-to-24 age group contributed 18.4 per cent of the growth in the labour force between 1976 and 1980, and are projected to account for only 6.8 per cent of the growth in the labour force between 1981 and 1986. The actual number of youths in the 15-to-19 age group will experience a net decline of 54,000 during this period. Almost two-thirds of this decrease will be accounted for by males.

- Persons in the 45-to-54 age group will account for only 7.7 per cent of the growth in the labour force during the 1981-86 period, a decline from their contribution of 8.4 per cent during the 1976-80 period.

6. Projections of Labour Supply by Source

In the previous section projections of the net additions to the labour force were presented. These were based on projected population and participation rates by age and sex. These estimates of net additions do not give a complete picture because they merely reflect changes in the stock between any two time periods. In reality, however, there is a continuous flow of persons into and out of the labour force. People withdraw from the labour force mainly because of retirement or death, though they may also withdraw in order to go back to school full-time, or because of illness, family responsibilities, or personal reasons; or because they decide to leave this province for another or to emigrate. People entering the labour force come from a variety of sources: they can be students who have finished their education and have entered the labour force full-time, persons from households who have decided to enter or re-enter the labour force, in-migrants, or immigrants and persons from the armed forces returning to civilian life.

This section provides a discussion of the labour supply available to Ontario labour force from: (a) the formal education sector in Ontario which includes Universities, Community Colleges, Secondary Schools, and Private Vocational Schools; (b) training programs including Apprenticeship Program,

Modular Training Program, Canada Manpower Training Program, Canada Manpower Industrial Training Program and Training in Industry; (c) the armed forces, i.e., persons who enter the civilian labour force after serving in the armed forces; (d) interprovincial and international migration; and (e) the household sector. A brief discussion of the projection from each of these sources is presented below.

6.a. The Education Sector

The projections of the labour supply from secondary schools, colleges, and universities in Ontario were prepared using a three-step process:

(i) The historical data by type of institution on full-time enrolments, graduates and those who leave the system without completing their education (i.e., "non-graduates"), were extrapolated to develop projections of the number of graduates, and non-graduates by broad education category.

(ii) Since not all of these graduates and non-graduates enter the labour force, it is necessary to identify those graduates and non-graduates who will be available to the labour force for the first time.[4]

Data on the proportion of graduates destined to the labour force are available from a number of sources.[5] To

---

[4]Some of these students continue their education while others leave the province or return to their home countries.

[5]Data on proportion of secondary school graduates potentially available to the labour force were obtained from Statistics Canada's USIS system and from Ministry of Colleges and Universities' OCIS (Ontario Colleges Information System).

Data on the proportion of CAATS graduates who are available for work were obtained from the Graduate Placement Reports of the OCIS System.

Data on the proportion of university graduates potentially available to the labour force were obtained from the 1979 Ontario Graduate Employment Survey data.

estimate the number of graduates available to the labour force in Ontario these ratios were applied to the projected number of graduates at each level of the education system.

Unlike the data for graduates, data on the destination of non-graduates are scarce. [6] However, the limited information available was used to adjust the projected number of non-graduates to obtain estimates of the number who would be available to the labour force in Ontario.

(iii) It can be argued that some of the graduates and non-graduates identified as potentially available to the labour force in the projections obtained above are already members of the labour force. According to the Labour Force Survey, in 1980, 41.0 per cent of the full-time students in secondary schools, 32.9 per cent of the full-time students in colleges and 28.7 per cent of the full-time students in universities were already participating in the labour force in Ontario. In order to estimate the number of new entrants to the labour force who are not already in the labour force we have excluded from the projections described above the proportion of students already in the labour force.

---

[6]The proportion of secondary school non-graduates potentially available to the labour force was obtained by excluding the proportion returning to the secondary school or continuing their education elsewhere. Data on these proportions were obtained from the Ministry of Eduction.

Data on the proportion of CAATS non-graduates who are available for work were obtained from the OCIS System.

Since no data on the labour force participation of non-graduates are available at the university level, it was assumed that all of them will be potentially available to the labour force in Ontario.

The formal education sector is the single largest source of labour supply in Ontario. The projections in Table 26 show that between 1981 and 1986, there will be 1.2 million full-time students graduating from secondary schools, community colleges and universities in Ontario. In addition, the number of full-time students who may withdraw from these institutions without completing their educational programs is projected to be approximately 500,000. In terms of the level of education of the 1.7 million full-time students who will graduate or withdraw from the formal education sector:

- 10.1 per cent or 171,900 would be university graduates;
- 7.8 per cent or 132,800 would be college graduates;
- 51.3 per cent or 875,400 would be secondary schools graduates;
- 5.2 per cent or 88,3000 would be non-graduates from universities;
- 9.0 per cent or 153,900 would be non-graduates from colleges;
- 16.6 per cent or 282,200 would be non-graduates from secondary schools.

Not all graduates or non-graduates enter the labour force. Some may continue their education, others may leave the province, and still others may return to the household sector. Of the graduates and non-graduates available to the labour force in Ontario some are already in the labour force. Therefore, as shown in Table 27 of the 1.7 million full-time students who will graduate or withdraw from the formal education sector during the projection period, only 647,100 students are projected to enter the labour force in Ontario for the first time. Approximately 44.5 per cent of the new entrants to the labour force from the education sector will not have completed their education either at the secondary or post-secondary level. The level of education achievement by the 647,100 new entrants to the labour force is expected to be as follows:

- 17.4 per cent or 112, 300 will have completed a university degree;

TABLE 26

GRADUATES AND NON-GRADUATES FROM THE EDUCATION SECTOR:

1986	25,900	25,500	12,700	10,200	18,200	9,400	56,800	45,100	101,900
TOTAL 1981-86	175,400	166,400	71,700	58,400	112,300	62,900	359,400	287,700	647,100

- 11.1 per cent or 71,700 will have completed a college education;
- 18.7 per cent or 121,300 will have completed some post-secondary education;
- 27.1 per cent or 175,400 will have completed grade 12 or 13;
- 25.7 per cent or 166,400 will have less than grade 12 education.

The following section briefly discusses the projections for each of the educational levels.

Projection by Educational Levels

Secondary Schools

As the size of the youth population declines, enrolments in grades 12 and 13 in secondary schools in Ontario are projected to decline by 17 per cent from 189,300 in 1981 to 157,100 in 1986 (see Table 28). This declining enrolment will in turn be reflected in the number of students graduating from secondary schools which is expected to decline from 157,300 in 1981 to 131,500 by 1986 (see Table 29).

Since many secondary school graduates continue their education at the post-secondary level, the number of graduates entering the labour force in Ontario during the 1981-86 period is projected to be 175,400 or 29,200 per year. During the same period, the number of non-graduates from secondary schools entering the labour force is projected to be 166,400 or 27,700 per year (see Table 31).

Altogether, there will be 342,000 persons (or 57,000 persons per year) entering the labour force from secondary schools in Ontario during the 1981-86 period. This constitutes more than half the total new entrants to the labour force from the formal education sector in Ontario.

Colleges of Applied Arts and Technology (CAATS)

Full-time enrolments in post-secondary programs at CAATS have been steadily increasing over the last five years and are projected to grow further reaching 89,300 by 1986 (see Table 28). Consequently, the number of graduates from CAATS is also projected to increase from 19,500 in 1981 to 23,600 in 1986 (see Table 29).

CAATS offer their programs through four major divisions: Business, Health, Applied Arts, and Technology. These programs vary in duration from 1 to 3 years and lead to employment in a wide variety of white- and blue-collar occupations.[7]

Our projections show that during the 1981-86 period, the total number of graduates from CAATS entering the labour force in Ontario is estimated to be 71,700 or about 12,000 per year. An overwhelming 92 per cent (65,700) of these will be from programs that lead to employment in white-collr occupations and only 8 per cent (6,000) are expected to be trained for blue-collar occupations.

In terms of duration of training, only 2 per cent of the new entrants will be graduates of three year programs which provide training for highly skilled blue-collar occupations and 6 per cent will be graduates of one and two year programs leading to medium skilled blue-collar occupations. The majority (68 per cent) of the new entrants will be graduates of one and two year programs that lead to employment in white-collar occupations and less than one-quarter will be from three year programs (see Table 32).

During the 1981-86 period, the total number of non-graduates from CAATS entering the labour force in Ontario is estimated to be 58,400, or about 9,700 per year.

---

[7]The projections of graduates and non-graduates were made for clusters of programs that correspond to the occupations for which they provide training. Then they were clustered into white- and blue-collar occupations by duration.

Universities: Undergraduate Programs

Data on full-time undergraduate enrolment at universities are presented in Table 28. These data show that full-time undergraduate enrolment fell by almost 5 per cent from the peak of 139,400 in 1976 to 133,000 students in 1978. Enrolment level has recovered slightly between 1978 to 1980. Since the 18-24 age group, from which Ontario universities currently draw more than 75 per cent of their enrolments, will continue to grow until 1983, full-time undergraduate university enrolment is likely to increase until then.

The total number of graduates from all undergraduate programs in universities will average 25,400 per year during the projection period (see Table 29). The number of full-time students who would withdraw from universities without completing their undergraduate programs is projected to be 14,700 per year (see Table 30).

Since not all graduates or non-graduates enter the labour market, the necessary adjustments were made to estimate the number of new entrants to the labour force. Based on these adjustments, it is estimated that, on average, 16,500 graduates and 10,500 non-graduates will enter the labour force annually from Ontario universities during the projection period (see Table 33).

The recent trends in full-time undergraduate enrolment by field of study indicate a shift in student preferences towards professional and career-oriented programs. Full-time undergraduate enrolment in Commerce and Business Administration, Engineering and Computer Science increased from 17.2 per cent of total full-time undergraduate enrolment in 1975-76 to 23.7 per cent in 1979-80. During the same period, enrolment in Arts and Science and Humanities declined from 38.4 per cent of the total enrolment in 1975-76 to 32.1 per cent in 1979-80 (see Table 34).[8] The present trends are likely to

---

[8]These trends have also been identified in The Report of the Committee on the Future Role of Universities in Ontario, August 1981, p.11.

continue to the extent that universities are able to shift their limited resources from one set of programs to another in the future.[9]

Universities : Graduate Programs

Full-time graduate enrolment as a percentage of full-time undergraduate enrolment declined from 11.8 per cent in 1975 to 10.8 per cent in 1979 (see Table 28). Our estimates show that during the 1981-86 period, the number of graduates from Masters programs will be 2,900 per year while those from Doctorate programs will be 400 per year (see Table 29). However, new entrants to the labour force with a Masters degree will number 1,900 per year, while those with a Ph.D. degree will number only 300 per year (see Table 33).

Our analysis of the currently available data indicates that few Canadians are being attracted to graduate program in many technical fields because of the attractive starting salaries offered by employers to those with undergraduate degrees.[10] In fact, full-time graduate enrolment in Engineering programs declined from 1,540 in 1975-76 to 1,266 in 1979-80. During the same period, full-time graduate enrolment in Computer Science declined from 277 to 209 (see Table 35).

Private Vocational Schools

Privately-owned and operated vocational schools offer training in secretarial and clerical work, bookkeeping, computer science, radio announcing, drafting, salesmanship, fashion modelling, hotel-motel management, engine repair, television electronics, welding, court reporting and other such subjects. The programs are provided in day or evening classes as well as by correspondence. The duration of courses offered range anywhere from 6 weeks to 2 years depending on how many hours of instruction are required and whether they are day, evening or correspondence courses.

---

[9]The Committee on the Future Role of Universities concludes that the funding proposed in the 1981 budget for universities is inadequate to meet the objectives set forth for the universities.

In addition, the Federal Task Force on the Labour Market in the 1980s suggests that less funds will be flowing to post-secondary institutions while the institutions are expected to expand programs that are among the most expensive to offer.

[10]These conclusions are also confirmed in The Report of the Committee on the Future Role of Universities in Ontario, August 1981.

TABLE 35

ACTUAL FULL-TIME GRADUATE ENROLMENT BY MAJOR FIELD OF STUDY

ONTARIO, 1975-1979

Source: Statistics Canada, USIS Files.

Only since the fall of 1980, schools registered with the Ministry of Colleges and Universities under the Private Vocational Schools Act are being required to report on enrolments and graduates to the Ministry. Prior to that, it was done on a voluntary basis and therefore the data on enrolment and graduation are incomplete. The lack of data precludes the possibility of estimating the potential labour supply from this source.

6.b. Other Training Programs

In addition to the formal education sector, there are many training programs aimed at upgrading, training or retraining persons who are already in the labour force. This type of training facilitates occupational mobility both within the same group of occupations and also between occupation groups requiring different education and/or training requirements. Therefore, while these programs do not increase the total supply of labour, they are an important source for increasing the labour supply in certain occupations. The major training programs are:

- The Apprenticeship Program
- The Modular Training Program
- The Canada Manpower Training Program (CMTP)
- The Canada Manpower Industrial Training Program (CMITP)
- In-House Training in Industry

A brief description of these programs is provided in Appendix XXI. Most of these training programs are aimed at blue-collar occupations. They provide upgrading, training or retraining to persons with low level skills so that they can move into medium and highly skilled blue-collar occupations.

Our projections show that between 1981 and 1986, 52,800 trainees would complete an apprenticeship or modular training program and would be qualified to enter the highly skilled blue-collar occupations (see Table 36 and Appendix XXI). The distribution of apprenticeship and modular training completions by broad occupation groups over the 1981-86 period is projected to be as follows:

- 25.6 per cent or 13,500 in construction trades;

TABLE 36

APPRENTICESHIP COMPLETIONS, ONTARIO, 1976-77 TO 1985-86

SERVICE	440	412	407	439	600	600	600	500	500	500	3,300
INDUSTRIAL	-	-	-	4	-	100	800	800	800	800	3,300
TOTAL REGULATED TRADES	3,860	4,225	4,541	4,139	5,000	5,000	5,800	5,100	5,100	5,100	31,100
TOTAL NON-REGULATED TRADES	525	474	618	454	600	800	800	900	900	900	4,900
GRAND TOTAL	4,385	4,699	5,159	4,593	5,600	5,800	6,600	6,000	6,000	6,000	36,000

Note: All projected data have been rounded to the closest hundred.

Sources: a) Compiled from the data supplied by Apprenticeship Branch, Ministry of Colleges and Universities.

b) Apprenticeship completions have been projected based on the relationship between registrations and completions lagged four years. Completions for 1985 and 1986 are assumed to be at the same level as in 1984.

- 25.6 per cent or 13,500 in automotive trades;
- 6.2 per cent or 3,300 in service trades;
- 12.9 per cent or 6,800 in mining;
- 14.2 per cent or 7,500 as stationary engineers;
- 6.2 per cent or 3,300 in industrial trades;
- 9.3 per cent or 4,900 in non-regulated trades.

Because of the lack of data, we were unable to make projections of labour supply of highly and medium skilled workers that could be available through the CMTP, CMITP, and in-house training in industry.

6.c. The Armed Forces[11]

The armed forces has 116 training establishments in 34 different locations. There are 21 schools at 9 units which concentrate on basic trades qualifications. They offer 3,000 courses varying in length from a couple of days to more than a year. Over a year 45,000 persons go through training programs of different duration in white- and blue-collar occupations.

The armed forces recruits 12,500 persons annually at the national level of which approximately 40 per cent are high school graduates. Thirty six per cent of the recruits are from Ontario. The Department of National Defence (DND) loses approximately 11,000 persons annually due to attrition. Almost all of these people enter the labour force. Of the 11,000 who leave the DND, approximately:

- 9.1 per cent are officers who are fully trained for professional occupations;
- 36.4 per cent are highly skilled tradesmen;
- 54.5 per cent vary from trade qualified to recruit failures. But many have immediate usable skills in the market place.

---

[11]The information presented in this section is obtained from the Minutes of Proceedings and Evidence of the Special Committee on Employment Opportunities for the '80s, House of Commons, May 1981.

If we assume that recruits from Ontario will return to Ontario when they leave the DND, then we should expect approximately 4,000 persons per year to enter Ontario's Labour force upon leaving the armed forces. If we further assume that this number will remain constant over the projection period then 24,000 persons should be available to Ontario's Labour force between 1981 and 1986. The distribution by education and/or skills level of these new entrants to the labour force is projected to be as follows:

Professionals	2,200
Highly Skilled Blue-Collar Occupations	8,700
Medium Skilled White-Collar Occupations	6,600
Medium Skilled Blue-Collar Occupations	6,500

6.d. Interprovincial and International Migration

This section provides projections of the potential labour supply available to Ontario from interprovincial and international migration.

Interprovincial Migration

Through interprovincial migration Ontario has experienced net losses to other provinces (particularly B. C. and Alberta) every year since 1973-74, except in 1977-78 when it experienced a net gain due to the inflow from Quebec. The historical data on interprovincial migration both into and out of the province for the years 1970 to 1980 are presented in Table 37.

For the purposes of this report, the projections of interprovincial migration for the years 1981 to 1986 were obtained from Statistics Canada and are presented in Table 38. These projections assume that the shift in population from Ontario to Alberta and British Columbia will continue throughout the projection period.

The estimates of interprovincial migrants who will enter the labour force in Ontario and their occupational composition were obtained from Statistics Canada. The data were grouped according to the level of formal education or years of special vocational training in occupational clusters defined in Chapter I.

Source: Unpublished data from Statistics Canada

The projections by level of education and/or training of net interprovincial migrants (in-migrants minus out-migrants) destined to the labour force are provided in Table 39 and show that between 1981 and 1986 there will be a net out-migration of 67,500 persons from Ontario to other provinces. The occupational composition of these out-migrants by level of education and/or training is as follows:

- 2,000 in occupations primarily filled by university graduates;
- 6,700 in occupations primarily filled by college or university graduates;
- 4,600 in occupations primarily filled by college graduates;
- 14,500 in occupations normally not requiring college or university graduation;
- 19,500 in highly skilled blue-collar occupations;
- 13,100 in medium skilled blue-collar occupations;
- 7,100 in low skilled blue-collar occupations.

International Migration

The data presented in Table 40 show that the number of immigrants to Canada declined from a high of 214,000 in 1973-74 to a low of 82,000 in 1978-79. The proportion of those immigrants destined for Ontario also declined from a high of 56 per cent in 1973-74 to only 46 per cent in 1979-80. While the number of immigrants coming to Ontario has declined, emigration from Ontario to other countries has remained relatively stable at between 30,000 to 40,000 per year during the 1970-80 period. As a result, net immigration (immigration minus emigration) to Ontario from outside Canada declined from a high of 81,000 in 1973-74 to only 5,000 in 1978-79.

For the purposes of this report, the projections of net international migration to Ontario for the years 1981 to 1986 were obtained from Statistics Canada. These projections assume a net inflow of approximately 162,000 persons in all age groups from outside Canada to Ontario between 1981 and 1986. The projections of the proportion of these 162,000 persons who will enter the labour force and the educational attainment levels of the projected labour force entrants were obtained in the manner described in the previous section

Note : [a]Preliminary Data
Source: Statistics Canada, International and Interprovincial Migration in Canada, Cat. No. 91-208, (Ottawa)

and are presented in Table 41. These projections show that there will be a net immigration to the Ontario labour force of 82,400 persons between 1981 and 1986. The educational attainment of these immigrants will be as follows:

- 4,200 in occupations primarily filled by university graduates;
- 13,200 in occupations primarily filled by university or college graduates;
- 7,100 in occupations primarily filled by college graduates;
- 19,600 in occupations normally not requiring college or university graduation;
- 17,300 in highly skilled blue-collar occupations;
- 11,600 in medium skilled blue-collar occupations;
- 9,400 in low skilled blue-collar occupations.

6.e. The Household Sector

In addition to the formal education sector and interprovincial and international migration, another potential source of labour supply is the household sector. The projections of potential labour supply from the household sector have been estimated as a residual. Briefly, net additions to the labour force are the result of the sum of the net flows to the labour force from the education sector, interprovincial and international migration and household sector minus deaths and retirements from the labour force.

Projections of net additions to the labour force and new entrants from the education sector and net interprovincial and international migration were presented in the previous sections. Attrition from the labour force due to deaths and retirements was calculated in the manner described in Chapter I, section 5. Since the net flow from the household sector to the labour force is the only unknown, estimates of the labour supply from this source for the projection period 1981-86 were obtained as a residual.

There is no information regarding the educational attainment of the labour force entrants from the household sector. A large number of the labour force entrants are likely to be adult women in the 25-to-64 age group. Data on the educational attainment of adult women who were not in the labour force in

TABLE 41

PROJECTIONS OF POTENTIAL LABOUR SUPPLY FROM
NET INTERNATIONAL MIGRATION BY EDUCATION LEVEL
ONTARIO, 1980-81 TO 1985-86

EDUCATION LEVEL	1980-81	1981-82	1982-83	1983-84	1984-85	1985-86	Total 1981 to 1986

Highly Skilled	2,800	2,900	2,900	2,900	2,900	2,900	17,300
Medium Skilled	1,900	1,900	1,900	1,900	2,000	2,000	11,600
Low Skilled	1,500	1,500	1,600	1,600	1,600	1,600	9,400
TOTAL: WHITE-COLLAR AND BLUE-COLLAR	13,200	13,600	13,700	13,700	14,100	14,100	82,400

1980 was obtained from Statistics Canada. This information was used to distribute the estimates of labour force entrants from the household sector by level of education. These projections show that between 1981 and 1986, 319,000 persons will be available to the labour market in Ontario from the household sector. Their educational attainments are as follows:

- 16,800 will have university education;
- 28,600 will have college education;
- 16,600 will have some post-secondary education;
- 167,300 will have high school education;
- 89,700 will have less than 8 years of education.

7. Summary of the Total Labour Supply in Ontario

The projections of the total labour supply in Ontario for the period 1981-86 from the education sector, household sector and net interprovincial and international migration are summarized in Table 42. The highlights of these projections are as follows:

(i) Between 1981 and 1986, the total labour supply in Ontario is projected to be just over one million persons.

(ii) The formal education sector will provide roughly 65 per cent (approximately 647,100 persons) of the total labour supply in Ontario. The household sector will contribute nearly 32 per cent (319,000 persons) of the total labour supply and approximately 8 per cent (82,400 persons) will come from net international migration. Ontario will lose 67,500 workers to other provinces during the projection period.

(iii) The educational achievement of the 647,100 new entrants to the labour force from the formal education sector is projected to be as follows:

- 17.4 per cent or 112,300 will have completed a university degree;

TABLE 42

PROJECTIONS OF TOTAL POTENTIAL LABOUR SUPPLY IN WHITE- AND BLUE-COLLAR OCCUPATIONS BY SOURCE, EDUCATION/TRAINING, ONTARIO: 1981-1986

Sources of Labour Supply	White-Collar Occupations					Blue-Collar Occupations				Total
	Univ.	Univ. or CAATS	CAATS	H.S. grads. & Some Post Secondary	Total White	Highly Skilled	Medium Skilled	Low Skilled	Total Blue

3. Armed Forces	2,200	-	-	6,600	8,800	8,700	6,500	-	15,200	24,000
4. Migration										
Inter-Provincial	-2,000	-6,700	-4,600	-14,500	-27,800	-19,500	-13,000	-7,100	-39,700	-67,500
International	4,200	13,200	7,100	19,600	44,100	17,300	11,600	9,400	38,300	82,400
5. Household Sector	16,800	-	28,600	183,900	229,300	-	-	89,700	89,700	319,000
TOTAL	133,500	6,500	96,800	492,300	729,100[b]	60,800	9,500	258,400	328,700[b]	1,005,000[c]

NOTE: Since "Other Training Programs" provide upgrading or retraining to persons already in the labour force, they do not increase the actual labour supply. Therefore, the figures indicated by the superscript "a" are not counted as part of the total labour supply estimate, i.e., grand total shown by superscript "c". Similarly, the figure marked with superscript "b" at the bottom row of the table would not add up to this grand total because they represent those who are already members of the labour force while acquiring higher level skills.

- 11.1 per cent or 71,700 will have completed a college education;
- 18.7 per cent or 121,300 will have completed some post-secondary education;
- 27.1 per cent or 175,400 will have completed grade 12 or 13;
- 25.7 per cent or 166,400 will have less than grade 12 education.

(iv) The educational attainment of the 319,000 persons who will enter the labour force over the 1981-86 period from the household sector is projected to be as follows:

- 16,800 will have university education;
- 28,600 will have college education;
- 16,600 will have some post-secondary education;
- 167,300 will have high school education;
- 89,700 will have less than 8 years of education.

(v) In addition to the new entrants to the labour force from various sources, our projections show that between 1981 and 1986, 52,800 trainees would complete an apprenticeship or modular training program and would be qualified to enter the highly skilled blue-collar occupations. The distribution of apprenticeship and modular training completions by broad occupation groups over the 1981-86 period is projected to be as follows:

- 25.6 per cent or 13,500 in construction trades;
- 25.6 per cent or 13,500 in automotive trades;
- 6.2 per cent or 3,300 in service trades;
- 12.9 per cent or 6,800 in mining;
- 14.2 per cent or 7,500 as stationary engineers;
- 6.2 per cent or 3,300 in industrial trades;
- 9.3 per cent or 4,900 in non-regulated trades.

CHAPTER III

IMBALANCES BETWEEN PROJECTED MANPOWER REQUIREMENTS AND LABOUR SUPPLY: ONTARIO, 1981 TO 1986

This chapter provides a comparison of the projected manpower requirements presented in Chapter I and the total labour supply presented in Chapter II and thus identifies the areas of potential imbalances in Ontario's labour market during the 1981-86 period. It also examines the available evidence on recent labour market experience of university and college graduates in Ontario.

The chapter begins with a comparison of the projected labour force and employment to determine the anticipated level of unemployment, and the unemployment rates, during the projection period. This is followed by a discussion of the potential imbalances between total job openings and labour supply both at the aggregate level and for white- and blue-collar occupations by level of education and training. It concludes with a summary of the principal areas of imbalances thus identified.

1. The Unemployment Rate

One way of examining the labour market imbalances is to make a year-by-year comparison of the projected employment and the labour force in Ontario. The imbalances between these figures provide an estimate of the number of persons who may be unemployed and the expected unemployment rate.

The projections of employment (medium-growth scenario) and the labour force (Projection II) for Ontario between 1981 and 1986 are presented in Table 43. These projections indicate that the unemployment rate in Ontario will drop from 6.9 per cent in 1980 to 6.4 per cent in 1981, rise to 6.7 per cent

TABLE 43

ACTUAL AND PROJECTED EMPLOYMENT, LABOUR FORCE, AND UNEMPLOYMENT IN ONTARIO: 1975 TO 1986

Year	Total Employment ('000s)	Total Labour Force ('000s)	Change from Previous Year		Number Unemployed ('000s)	Unemployment Rate (%)
			Employment ('000s)	Labour Force ('000s)		
Actual						
1975[a]	3,576	3,818	--	--	242	6.3
1976[a]	3,645	3,885	69	67	240	6.2
1977[a]	3,717	3,994	69	109	277	6.9
1978[a]	3,847	4,147	133	153	300	7.2
1979[b]	4,008	4,289	161	142	281	6.6
1980[b]	4,066	4,366	58	77	300	6.9
Projected:						
1981	4,191[c]	4,479[d]	125	113	288	6.4
1982	4,279	4,585	103	106	306	6.7
1983	4,393	4,687	114	102	294	6.3
1984	4,508	4,783	115	96	275	5.7
1985	4,616	4,877	108	94	261	5.4
1986	4,729	4,965	113	88	236	4.8

d. Projection II, see Table 22 in Chapter II.

in 1982, and gradually drop thereafter to 4.8 per cent by 1986.[1] This implies that the growth in the labour force will be less rapid than the growth in employment. In other words, Ontario will experience a relatively tight labour market over the projection period.

2. Total Job Openings and Labour Supply

Another way of looking at the imbalance question is to examine the total job openings and the potential labour supply rather than just comparing the employment level and the labour force in each year of the projection period. Total job openings consist of job openings resulting from employment growth and those created due to deaths and retirements from the labour force, while the total labour supply comprises of new entrants to the labour force from the education sector, net migration, the armed forces and the household sector.[2] A comparison of the total job openings and total labour supply in

---

[1]This projected unemployment rate for 1986 is well below the full-employment norm of 5.3 per cent postulated by the Ministry of Treasury and Economics in the 1977 Ontario budget. However, it should be noted that the levels of output and employment projected in this report may not materialize due to potential labour market bottlenecks in Ontario. If the shortage of experienced and skilled workers persists over the projection period, it is unlikely that the projected level of employment growth can be achieved over the 1981-86 period.

In addition, the projections of growth in real output and employment presented in this report do not take into account the impact of recent energy price agreement signed by the Federal and Alberta governments. The higher energy prices are likely to depress the short-run growth in real output and employment. The longer-run impact on economic growth would depend upon the investment strategies to be adopted by the oil industry and the monetary and fiscal policies to be pursued by the federal and provincial governments.

[2]Theoretically, for the purposes of computing imbalances between manpower requirements and supply, the estimate of potential labour supply should include the pool of unemployed workers and the estimate of labour demand should include the number of job vacancies. It could be argued, however, that in a dynamic labour market the number of workers counted as unemployed at any given point of time reflect only a fraction of the flows of workers into and out of employment. According to the 1977 Ontario budget document, 5.3 per cent of the unemployment is attributable to these flows. Therefore, in an accounting sense the pool of unemployed workers who could be available is equivalent to the difference between 5.3 per cent and the prevailing unemployment rate. In 1980, the average annual unemployment rate for Ontario was 6.9 per cent. Therefore, the pool of surplus labour that could be available was only 1.6 per cent. In this study we have assumed, that the difference between potential labour supply from the pool of unemployed workers and the job vacancies that might exist is likely to be very small.

Ontario for the 1981-86 period is presented in Table 44. These data show that in the medium-growth economic scenario, the total labour supply will fall short of total job openings in every year of the projection period, except 1982. In 1982, the total labour supply is projected to exceed total job openings by 25,000.

A comparison of total job openings and total labour supply at the aggregate level could conceal the potential labour market imbalance that might exist at the detailed occupational levels. Therefore, to provide a more complete picture of these potential imbalances a detailed analysis of the job openings and labour supply in white- and blue-collar occupations by level of education and training is presented below.

3. Imbalances in White-Collar Occupations

Between 1981 and 1986 all three scenarios envisage that approximately four out of every seven job openings in Ontario will be in white-collar occupations. Roughly 62 per cent of these white-collar jobs will be concentrated in two industries: trade (32 per cent), and community, business and personal services (30 per cent).

The total supply of white-collar workers during the 1981-86 period is projected to be 729,100. The number of job openings for white-collar occupations during this period in the high-growth scenario is projected to be 580,600. This means that even in the high-growth scenario labour supply will exceed the requirements by 148,500. Under the low-growth and medium-growth scenarios, there will be an over-supply of 186,500 and 162,800 workers, respectively (see Table 45).

About 31 per cent of the projected 542,600 white-collar job openings in the low-growth scenario and 29 per cent of the 580,600 job openings in the high-growth scenario will be created to meet replacement needs. The proportion of job openings due to replacement needs is much higher in the manufacturing industries: almost 49 per cent in the low-growth scenario and 43 per cent in the high-growth scenario.

Within the broad category of white-collar occupations, imbalances between job openings and labour supply are examined by level of education in the following sections.

TABLE 44

PROJECTED ANNUAL TOTAL JOB OPENINGS, TOTAL LABOUR SUPPLY AND OVERALL IMBALANCES IN ONTARIO, 1981 TO 1986

Year	Projected Total Job Openings[a]	Projected Total Labour Supply[b]	Overall Surplus (+) or Shortage (-)
1981	177,900	174,500	-3,400
1982	143,800	168,800	+25,000
1983	170,100	165,600	-4,500

TABLE 45

A COMPARISON OF PROJECTED REQUIREMENTS AND SUPPLY BY LEVEL OF EDUCATION: ONTARIO

1981 TO 1986

Projected Total Job Openings: 1981 - 1986				Projected Total Labour Supplies: 1981 - 1986						
Education Level	Low Growth	Medium-Growth	High-Growth	Education Level	Formal Education Sector	Apprentice-ship & Modular Training	Armed Forces	Net Migration	Household Sector	Total
White-Collar Occupations: Total	542,600	566,300	580,600	White-Collar Occupations: Total	474,700	-	8,800	16,300	229,300	729,100
Primarily filled by University graduates	42,500	44,300	45,400	University Graduates	112,300	-	2,200	2,200	16,800	133,500
Primarily filled by University or College or Certified Professionals	137,100	143,100	146,700	University or College Graduates	-	-	-	6,500	-	6,500
Primarily filled by College Graduates	72,200	75,300	77,200	College Graduates	65,700	-	-	2,500	28,600	96,800
Normally not Requiring College or University Graduation	290,800	303,500	311,200	Some Post-Secondary Education & Secondary-School Graduates	296,700	-	6,600	5,100	183,900	492,300
Blue-Collar Occupations: Total	378,800	403,500	417,600	Blue-Collar Occupations: Total	172,400	52,800	15,200	-1,400	89,700	328,700
Highly Skilled	98,800	105,200	108,900	Highly Skilled	1,500	52,800	8,700	-2,200	-	60,800
Medium Skilled	50,900	54,200	56,100	Medium Skilled	4,500	-	6,500	-1,500	-	9,500
Low Skilled	229,100	244,000	252,600	Low Skilled (less than Grade 12)	166,400	-	-	2,300	89,700	258,400
Other "Unspecified" Occupations	49,900	51,400	53,000							
Total Job Openings: 1981-1986	971,200	1,021,200	1,051,200	Total Labour Supplies: 1981-1986	647,100	52,800	24,000	14,900	319,000	1,005,000[a]

[a]The individual row and column totals do not add up to the grand total. For explanation please refer to footnote in Table 42.

3.a. University and College Graduates

In terms of the imbalances between the projected requirements for and supply of persons with a college or university degree, these projections show that during the 1981-86 period there will be 251,800 job openings for persons with a college or university degree in the low-growth scenario and 269,300 in the high-growth scenario. During the same period, 236,800 persons with these qualifications will enter the labour force. These data suggest that there will be a supply shortfall of 15,000 even in the low-growth scenario, and a shortfall of 32,500 in the high-growth scenario.

It is important to note that while these projections imply an overall shortage of university and college graduates combined, there will be only 45,400 job openings that can be filled primarily by university graduates in the high-growth scenario. There would be an additonal 146,700 white-collar job openings that can be filled by either university or college graduates. The labour supply projections show that 133,500 university graduates will enter the labour market during this period. In other words, even under the high-growth scenario, at least 88,100 university graduates will be unable to find jobs which are filled primarily by university graduates and will therefore be competing for jobs that can also be filled by college graduates.

These projections show that for the 96,800 college graduates who will be entering the Ontario labour market between 1981 and 1986 there will be 72,200 job openings that these graduates can fill in the low-growth scenario, and 77,200 job openings in the high growth scenario. Even in the low-growth scenario, the remaining 24,600 college graduates can also compete for the 137,100 job openings that can be filled either by university or college graduates. In other words, the employment opportunities for college graduates appear to be more promising than those for university graduates.[3]

---

[3]In a period when competition for these types of jobs is particularly strong, the operation of the labour market will tend to inflate the qualification required for the job in practice (though perhaps not as advertised). Under these conditions, the employment prospects of university graduates will be enhanced vis-a-vis those of college graduates.

This trend is already evident from the labour market experience of recent university graduates in Ontario. Detailed information on the employment experience of university graduates is available from the survey of 1976 university graduates conducted by Statistics Canada[4], and the survey of 1979 university graduates conducted by the Ontario Ministry of Colleges and Universities.[5] In addition, a study on the educational achievements and work destination of Ontario youth, conducted by Aniseff et al for the Ministry of Colleges and Universities, also provides information on the employment experience of students. The Aniseff et al study was based on a six-year follow-up of high school students who continued post-secondary education.[6] All these surveys indicate that a significant proportion of university graduates are either underemployed or employed in work that is not related to their field of study.

The concept of "underemployment" is difficult to define and even more difficult to measure.[7] In these surveys for statistical purposes, "university graduates were classified as under-employed if they had jobs that did not require a university degree".[8] According to the survey conducted by Statistics Canada, approximately one-third of the 1976 university graduates in Ontario were underemployed and their numbers increased to 39 per cent in the survey of 1979 university graduates (see Table 46). In other words, they had jobs that required only a college or secondary school education. The estimate

---

[4]W. Clark and Z. Zsigmond, Job Market Reality for Post-secondary Graduates, Statistics Canada, March 1981.

[5]University Affairs Division, Employment Survey of 1979 Graduates of Ontario Universities, Ministry of Colleges and Universities, October 1980.

[6]Paul Aniseff, J. Grofried Paasche and Anton H. Turrittin, Is the Die Cast, Ministry of Education and Colleges and Universities, 1980.

[7]One aspect of this definitional problem stems from the general philosophical question of what a university education is intended for. It can be argued that general programs of study in the arts and sciences have as only part of their objective the improvement of their graduates' job prospects in the labour market. In the view of many educators (as well as students) of equal or perhaps greater importance is the personal and intellectual development of the student. In this context, the extent to which university education ought to promote employability or ought to be reflected as a qualification for entry into broad sectors of the labour market becomes somewhat unclear. The concept of underemployment among university graduates should therefore be interpreted within this broad framework.

(b) Partial	%	41.6	22.9	
(c) Non-Related	%	21.2	13.2	23.5

Notes: 1. The table represents the employment experience of 1976 graduates in June 1978, two years after graduation and the employment experience of 1979 graduates one year after graduation.

2. The extent of underemployment and the Job-Education Fit relate only to graduates who are employed full-time.

Sources: a. W. Clark and Z. Zsigmond, Job Market Reality for Post-Secondary Graduates, Statistics Canada, Ottawa, March 1981.

b. University Affairs Division, Employment Survey of 1979 Graduates of Ontario Universities, Summary Report, Ministry of Colleges and Universities, October 1980.

of underemployment suggested by the Aniseff et al study was even higher: 53.7 per cent and 63.3 per cent for men and women respectively, with university degrees in first full-time jobs.[9]

According to these surveys, not all university graduates face similar prospects of underemployment. The 1976 university graduates in Humanities (45.7 per cent) and Social Sciences (44.3 per cent) were underemployed the most, while graduates from fields of study which are more labour-market oriented such as Education (9.8 per cent), Engineering (12.9 per cent), and the Health professions (17.5 per cent) were underemployed the least.

About 21.2 per cent of the 1976 Ontario university graduates were in jobs that were not related to their training. This figure was even higher, at 23.5 per cent, for the 1979 university graduates. By field of study, more than a quarter of the 1976 university graduates in Humanities, Social Sciences, and Agricultural and Biological Sciences were in jobs unrelated to their training.

While a large proportion of university graduates may be underemployed or employed in jobs unrelated to their field of study, shortages are and probably would continue to be experienced in certain specific fields of study. A study recently completed by the Labour Market Research Group of the Ontario Manpower Commission on manpower requirements and supply in the microelectronics industry concludes that the supply of electrical and electronics engineers and computer specialists available from Ontario universities and colleges will probably fall short of meeting the projected requirements of the microelectronics industry over the 1981-85 period.[10]

The shortage situation in certain specific fields of study could be aggravated by the fact that an increasing proportion of university graduates in Ontario is leaving the province. In fact, the 1979 survey showed that fewer of

---

[9]The Aniseff et al study used the average GED (General Educational Development) scores for each occupational group to estimate the degree to which respondents with university degrees had jobs that did not require the level of education they had attained.

[10]Professional and Technical Manpower Requirements and Supplies in the Microelectronics Industry in Ontario: 1981-to-1985, Labour Market Research Group, Ontario Manpower Commission, May 1981.

the 1979 university graduates (84.5 per cent) remained in Ontario compared with the 1976 university graduates (89.0 per cent).

The survey of 1976 college graduates conducted by Statistics Canada shows that underemployment among college graduates was not as prevalent as among university graduates. Only 28.5 per cent of the 1976 college graduates were underemployed compared with 33.8 per cent of university graduates.[11] Also, since college programs tend to be more labour market oriented, only 13.2 per cent of the 1976 college graduates were in jobs not related to their training compared to 21.2 per cent of the 1976 university graduates (Table 46).

Not only are the overall prospects for employment for college graduates during the projection period promising but in certain fields (especially the technology programs) the requirements are likely to exceed the supply. The Commission's study on the microelectronics industry indicates that the supply of draftsmen, engineering technicians and technologists, and other computer-related technicians available from the community colleges in Ontario, is likely to fall short of the projected requirements of this industry over the 1981-85 period.

The shortages situation could be aggravated by the fact that, as in the case of university graduates, many college graduates in Ontario are leaving the province. The survey of 1976 Ontario college graduates shows that Ontario had experienced a net loss of 5 per cent (864) of its 1976 college graduates as a result of this out-migration.

3.b. Other White-Collar Occupations

In relation to job openings which normally do not require a college or university degree, only 311,200 job openings would become available during the projection period in the high-growth scenario. During this period, 492,300 persons will be entering the white-collar labour force with some or no post-secondary education. Therefore, even under the high-growth scenario Ontario will be experiencing an oversupply of 181,100 workers in occupations not requiring a collge or university degree. The surplus of labour in these occupations will increase to 188,800 and 201,500 in the medium- and low-growth scenarios, respectively.

---

[11] W. Clark and Z. Zsigmond, Ibid.

4. Imbalances in Blue-Collar Occupations

The total labour supply of blue-collar workers during the 1981-86 period in Ontario is projected to be 328,700. The number of job openings for blue-collar occupations during this period under the low-growth scenario is projected to be 378,800. This means that even under this scenario at the aggregate level the supply will fall short of requirements by 50,100. In the medium-growth and high-growth scenarios the short fall will increase to 74,800 and 88,900 workers, respectively (see Table 45).

Between 1981 and 1986 more than 42 per cent of the 378,800 blue-collar job openings in the low-growth scenario, and 38 per cent of the 417,600 blue-collar job openings in the high-growth scenario, will become available because of replacement needs.

The imbalances in blue-collar occupations by level of skill are discussed below:

4.a. Highly Skilled Blue-Collar Occupations

In this study, the highly skilled blue-collar occupations have been defined as those that require more than two years of training. The number of job openings for these highly skilled tradespeople during the projection period will range from 98,800 in the low-growth scenario to 108,900 in the high-growth scenario.

During this period a total of 63,000 persons will be entering the highly skilled labour force from Ontario's community colleges, apprenticeship and modular training programs, and from the armed forces.

The number of graduates from community colleges entering the highly skilled blue-collar occupations during this period will be 1,500, a mere two per cent of the total college graduates entering the labour market from the education sector in Ontario, and 52,800 will come from the apprenticeship and modular training programs. The balance of 8,700 will come from the armed forces.

Unlike the experience of past years, international migration will not be a significant source of labour supply for highly skilled workers during the projection period. In addition, the increasing trend toward out-migration of highly skilled workers from Ontario will result in Ontario experiencing a net loss of 2,200 highly skilled workers during the projection period due to both international and interprovincial migration.

The total labour supply of highly skilled workers through the apprenticeship and modular training programs, the armed forces, and through net migration is projected to be 60,800. This suggests that even in the low-growth scenario there will be a shortfall of 38,000 workers. This shortfall will increase to 48,100 in the high-growth scenario.

The shortage of highly skilled workers was evident in a survey on current manpower shortages and the future skill requirements for the manufacturing industries in Ontario, conducted by the Labour Market Research Group of the Ontario Manpower Commission in July and August 1979[12]. The survey indicated that the shortage of manpower in the manufacturing industries was concentrated in the following highly skilled blue-collar occupations: machine operators, general machinists, tool and die makers, mould makers, welders, welder fitters, assembler fitters, and electricians.

The survey results showed that the current shortages would worsen in the future as the in-flow of skilled immigrants declines, leading to an increasing demand on domestic sources. Many employers thought that the education system had failed to produce the industrial skills and problem-solving ability needed by the industry.

It is important to note, however, that there are many persons who are being trained by employers through on-the-job training who are not included in the data presented in this report. Very little is known about the nature and magnitude of such in-house training in industry. Therefore, it was not possible to estimate the potential supply of highly skilled workers that could be available from this source. It is, therefore, likely that our estimates of the magnitude of shortages in the highly skilled occupations are overstated.

---

[12] Manpower Requirements and Hiring Plans of Ontrio Employers in Manufacturing Industries, Labour Market Research Group, Ontario Manpower Commission, 1979.

4.b. Medium Skilled Blue-Collar Occupations

In this study, the medium skilled blue-collar occupations are defined as those that require up to two years of training. The total number of job openings for these skilled tradespeople during the projection period will range from 50,900 in the low-growth scenario to 56,100 in the high-growth scenario.

The major sources of labour supply of medium skilled blue-collar workers are the Canada Manpower Training Programs and in-house on-the-job training in industry. However, because of the lack of data we were unable to make projections of potential labour supply of highly and medium skilled workers that could be available through these sources.

The other sources of supply for medium skilled blue-collar workers are the community colleges and the armed forces. During the 1981-86 period, 4,500 medium skilled blue-collar workers would enter the labour force from community colleges in Ontario and 6,500 from the armed forces.[13] Ontario will experience a net loss of 1,500 medium skilled workers as a result of international and interprovincial migration during the projection period. The total supply of medium skilled workers from these sources will therefore number only 9,500 during the projection period.

4.c. Low Skilled Blue-Collar Occupations

Job openings in low skilled blue-collar occupations are usually filled by persons with less than grade 12 education. Between 1981 and 1986, the total job openings in these occupations will number 279,000 in the low-growth scenario and 305,600 in the high-growth scenario.[14] A total of 258,400 persons with less than grade 12 education would be available to the labour force in

---

[13]The estimate of 4,500 from the Community College does not include the potential labour supply that may be available through the CMTP, CMITP, and TIBI programs.

[14]The numbers of job openings in other blue-collar occupations also include those for other "unspecified" occupations. If the other "unspecified" occupations are excluded, the shortage situation described in this section will be reversed to a surplus.

Ontario during this period. They include 166,400 school leavers, 2,300 net migrants, and 89,700 from the household sector.[15]

These figures suggest that in all three scenarios there will be a shortage of low skilled blue-collar workers to fill the available job openings. Usually the low skilled blue-collar occupations are characterised by simultaneous shortages and surpluses. People are often reluctant to enter these jobs because of the low wages, poor working conditions, and limited chances for advancement. As a result, it is quite possible that there may be a surplus of workers with few skills to offer, while at the same time shortages exist in blue-collar occupations for which they are qualified.

---

[15]It should be pointed out that while Ontario is experiencing an outflow of highly skilled and skilled persons there is an inflow of persons with less than grade 12 education.

APPENDIX XV

PERCENTAGE DISTRIBUTION OF WHITE-COLLAR AND BLUE-COLLAR OCCUPATIONS BY LEVEL OF EDUCATION/TRAINING: ONTARIO, 1971

	Percent
All White-Collar Occupations	100.0
Filled by University Graduates	7.8
Filled by University or College Graduates or Certified Professionals	25.3
Filled by College Graduates	13.3
Normally not Requiring College or University Graduation	53.6
All Blue-Collar Occupations	100.0
Highly Skilled Occupations	26.1
Medium Skilled Occupations	13.4
Low Skilled Occupations	60.5

Source: Derived from Statistics Canada, 1971 Census of Canada, Cat. No. 94-731.

APPENDIX XXI

OTHER TRAINING PROGRAMS IN ONTARIO

The Apprenticeship Programs

For those interested in learning skilled trades and becoming qualified tradespeople, the Ontario Ministry of Colleges and Universities offers apprenticeship training. The theory behind apprenticeship training emphasizes learning by doing. In Ontario, apprenticeship is a systematic program of on-the-job training and related classroom instruction designed to produce fully-qualified tradespeople or journeymen as prescribed in the Apprenticeship and Tradesmen's Qualification Act.

The minimum educational qualification to register as an apprentice is grade 8 to grade 10 depending on the trade. An apprentice while undergoing training is employed and therefore is in the labour force. Upon completion the trainee is qualified to enter highly skilled or in some cases medium skilled blue-collar occupations.

Apprenticeship training is offered in more than 300 trades in Ontario. These trades can be differentiated according to whether they are regulated or non-regulated under the Apprenticeship and Tradesmen's Qualification Act. A regulated trade is one that has been specifically identified under the Act as an apprenticeable trade and for which specific trade regulations are set down. Standard training schedules and examinations are also specified for the regulated trades. For the non-regulated trades there are no standard trade definitions and no fixed requirements for final examinations.

Among the regulated trades there are two kinds: those requiring compulsory certification (where you must possess a Certificate of Qualification or be a registered apprentice to work at the trade) and those requiring voluntary certification (where it is up to the worker whether or not he/she

wishes to qualify for a certificate of Qualification). Of the 60 regulated trades in Ontario, 17 require a compulsory Certificate of Qualification and the remaining 43 are regulated on a voluntary basis (see Appendix XXII for a list of the regulated trades). The regulated trades are concentrated primarily in two areas: construction trades and automotive and heavy equipment repair trades. Some of the service trades such as Barbers and Hairdressers are also covered under the regulated trades.

The non-regulated trades are concentrated primarily in the manufacturing sector where it is difficult to specify common training requirements within a trade because of variations between industries and even between plants within an industry. Only recently some of the industrial trades have become regulated; i.e., in 1978, General Machinist, Tool and Die Maker, and Mouldmaker became regulated. In 1979, Industrial Mechanic (Millwright) became regulated. However, they still do not require compulsory certification.

Historical data on apprenticeship registrations and completions were obtained from the Apprenticeship Branch of the Ministry of Colleges and Universities. Apprenticeship completions for the period 1981 to 1986 were projected based on current registrations and historical completion rates.

The projections of labour supply from the apprenticeship training programs are presented in Table 36. The data shows that, between 1981 and 1986, the total number of apprenticeship completions is projected to be 36,000. The distribution of these apprenticeship completions by broad trade groups is as follows:

- 30.5 per cent or 11,000 in construction trades;
- 37.5 per cent or 13,500 in motive power trades;
- 9.2 per cent or 3,300 in service trades;
- 9.2 per cent or 3,300 in industrial trades;
- 13.6 per cent or 4,900 in non-regulated trades.

The Modular Training Program

The modular training program is a performance-based training system as opposed to apprenticeship training which is time-based. It is delivered in incremental steps with accreditation for trainees provided at every interval.

The skill and knowledge components required in an occupation are identified and grouped into modules. The training package can then be tailored to individual training needs by pre-testing the individual and selecting only appropriate modules as necessary.

The modular training program was formally established in 1968. Although the modular training program is not covered by the Apprenticeship and Tradesmen's Qualification Act, it may be used to provide training in the "apprenticeable" trades. The modular training program has been experiencing a tremendous expansion in recent years. There are now well over 1,600 training modules that have been approved and validated by the Ministry of Colleges and Universities. More than 150 distinct training programs have been developed through this process.

Since the Modular Administrative System was developed only recently (1976 and 1977) data on active trainees and completions are available from 1978-79 only. These administrative data show that there were 4,932 active trainees in the modular training programs in 1979-80. Of these 2,805 completed training during 1979-80. The distribution of the number of trainees who completed their training during 1979-80 by occupation groups is as follows:

Mining	1,132
Stationary Engineers	1,251
Construction	422

If we assume that the number of persons completing the modular training program will remain constant at the 1979-80 level, then this program should enable 16,800 persons to move from low-level skills to highly-skilled blue-collar occupations during the 1981-86 period. The majority of these are likely to be stationary engineers or those in the mining occupations.

The Canada Manpower Training Programs

The Canada Manpower Training Programs offer members of the labour force an opportunity to acquire new skills for an occupation or to enhance their current skills or proficiency levels.

These programs are administered by the Canada Employment and Immigration Commission under the provision of the Adult Occupational

Training Act (AOTA). These programs are operated in cooperation with the provinces and are administered through the Canada Employment Centres. Two approaches to training are utilized - one involves institutional training and the other industrial (employer - centred) training.

The Institutional Training (CMTP)

Institutional training takes place in various educational establishments such as community colleges, institutes of technology and to a lesser extent in private vocational schools. There are six types of institutional training. They are: Basic Training for Skill Development (BTSD), Job Readiness Training (JRT), Work Adjustment Training (WAT), Language Training, Apprenticeship Training and Skill Training.

BTSD is designed to upgrade basic skills in mathematics, science and communication to the academic level required for entry into skill training. Language training in English or French is given primarily to new immigrants to enable them to obtain employment in their usual occupation. JRT is an employment - oriented training which may include elements of life skills, work experience, job orientation and academic upgrading. WAT is a type of training (sheltered workshop and job exposure) provided to adults who are faced with difficulties in obtaining or maintaining employment because of behaviour inconsistent with the requirements of employment.

The apprenticeship training under CMTP refers to the institutional portion of the training offered under the Apprenticeship and Tradesmen's Qualification Act. In terms of potential labour supply, the trainees under this program are included in the discussion on Apprenticeship programs discussed earlier.

In 1980-81, there were 55,286 trainees enrolled in full-time institutional training programs including the trainees under the apprenticeship programs. Of these, 72.2 per cent or 39,896 trainees completed the training programs.

Among the various institutional training programs, only skill training leads to the acquisition of occupational skills. In 1980-81, approximately 13,000 trainees were enrolled in skill training programs of various duration. Unfortunately, data on the distribution of these trainees either by duration of

training or occupation of training are not available. Consequently, we were unable to develop an estimate of the number of medium skilled workers who could be available upon completion of these programs over the projection period.

The Industrial Training (CMITP)

Industrial training takes place in an industrial setting where instruction may be given on-the-job, in a classroom or a special training area, or as a combination of the above methods. Canada Employment and Immigration Commission negotiates a contract with an employer or a group of employers in which the Commission agrees to reimburse a portion of certain training costs incurred by the employer.

Employer-centred training has two main components: the Canada Manpower Industrial Training Program (CMITP) and the Critical Trade Skills Training (CTST).

CMITP is a shared-cost incentive training program aimed at meeting the skill needs of employers. It improves the employability and earning capacity of workers through expansion and improvement of training provided by employers.

CTST is a new industrial training initiative which focusses on selected highly skilled trades and occupations. Its objective is to encourage industry to develop and expand the training of tradesmen in skilled occupations where chronic shortages are being experienced.

The length of training supported under the CMITP is of short duration. At present little information is available on either the number or the skill level of training provided under CMITP. It was, therefore, not possible to estimate the number of highly or medium skilled workers who could be available, through this source, over the projection period.

In-House Training in Industry

In addition to the traditional apprenticeship programs, many firms provide a variety of other formal and informal training programs to their employees. However, very little information is available on the extent and

nature of the training activity in industry. A survey[1] conducted by the Ontario Ministry of Labour in 1969 showed most of the trainees were enrolled in courses of very short duration. Only 9.5 per cent of the trainees received training of six months duration or more. Statistics Canada's supplementary Labour Force Survey[2] conducted in December 1973 reported that only 6 per cent of the trainees in industry training programs attended courses of 25 or more weeks of duration. According to a recent survey conducted by the Economic Council of Canada in 1980,[3] only 16.5 per cent of all trainees in Canada and 15.3 per cent of all trainees in Ontario were in programs of 6 months duration or more.

The conclusion that these studies arrived at is that most of the trainees are enrolled in courses of very short duration which implies that the magnitude of the skills developed through in-industry tranining programs in recent years may be limited.

APPENDIX XXII

LIST OF REGULATED TRADES IN THE APPRENTICESHIP TRAINING PROGRAM IN ONTARIO

Trade	Code	Periods of Hrs. in Prog.[1]
Construction		
Construction Boilermaker	428A	4 x 1650
Brick & Stone Mason	401A	4 x 1400
Cement Mason	419A	3 x 2000
Power Lineman	434A	4 x 2000
Constr. Lineman	434B	1 x 2500 2 x 2000
Constr. Maint. Electr.	309A	5 x 1800
Domestic & Rural Electr.	309C	4 x 1800
Glazier & Metal Mech.	424A	4 x 2000
Ironworker	420A	3 x 2000
Lather	418A	3 x 1800
Constr. Millwright	426A	4 x 2000
Comm. & Res. Painter	404A	3 x 1800
Industrial Painter	404B	3 x 1800
Plasterer	405A	4 x 1600
Plumber	306A	5 x 1800
Refrig. & Air Cond. Mech.	313A	5 x 1800
Sheet Metal Worker	308A	5 x 1800
Sprink. & Fire Prot. Inst.	427A	4 x 1800
Steamfitter	307A	5 x 1800
General Carpenter	403A	20 Units
Industrial		
General Machinist	429A	4 x 1500
General Machinist	429X	4 x 2000
Tool & Die Maker	430A	4 x 2000
Mould Maker	431A	4 x 2000
Ind. Mechanic (Millwright)	433A	4 x 2000
Fitter (Structural Steel/ Platework)	437A	3 x 1800
Motive Power		
Alignment & Brakes Mech.	310E	3 x 1800
Auto Body Repairer	310B	4 x 1800
Automotive Machinist	410K	4 x 1800
Automotive Painter	410N	2 x 1800
Fuel & Elec. Sys. Mech.	310C	3 x 1800
Farm Equipment Mech.	425A	5 x 1800
Heavy Duty Equip. Mech.	421A	5 x 1800
Motorcycle Mechanic	310G	3 x 1800
Motor Vehicle Mechanic	310A	5 x 1800
Service Station Attendant	422A	2 x 1800
Transmission Mechanic	310D	3 x 1800
Truck Trailer Repairer	310J	3 x 1800

Trade	Code	Periods of Hrs. in Prog.[1]
Motive Power Cont'd		
Small Engine Mechanic	435A	2 x 2000
Marina & Sm. Powered Equipment Mechanic	435B	2 x 2000
Small Eng. Mech. (Constr.)	435C	2 x 2000
Boat Motor Mechanic	435D	4 x 1800
Service		
Printer-Letter Press (Job Shop)	436A	4 x 2000
Printer-Lithography (Job Shop)	436B	4 x 2000
Offset Pressman (Plant)	436C	4 x 2000
Linotype Operator	436D	4 x 2000
Compositor	436E	4 x 2000
Pressman-Letter Press	436F	4 x 2000
Compositor-Photo Typesetting	436G	4 x 2000
Compositor & Camera Tech.	436H	5 x 2200
Baker 2	423A	3 x 2000
Junior Baker 1	423B	1 x 2000
Assistant Cook 1	415B	1 x 2000
Cook 2	415A	3 x 2000
Dry Cleaner	417A	4 x 900
Hairdresser	311A	3 x 1500
Hairstylist	332A	3 x 1580
Barber	312A	3 x 1500
Radio & Tele. Serv. Tech.	416A	4 x 2000
Watch Repairer	314A	3 x 1800

Notes: 1. Trades which require more than 2,000 hours of training were designated as highly skilled trades.
